RE: Monitoring and Reporting Requirements in the Stormwater Management/Urban Runoff Discharges NPDES Permit for Los Angeles County Flood Control District, County of Los Angeles and Cities of Los Angeles County

Dear Dr. Swamikannu:

Thank you for the opportunity to comment on the Stormwater Management/Urban Runoff Discharges NPDES Permit for Los Angeles County. In general we are concerned that permit requirements are too vague and the TMDL requirements are not incorporated into the permit.

1. Receiving Waters Studies

The requirements for this section are vague and the categories of studies to be conducted are too broad.

A. "Receiving Water Monitoring" should replace "Natural Stream Studies", and should be required in all five major watersheds. We recommend a program similar to that of the San Diego Municipal separate Storm Sewer System NPDES permit (Order No. 2001-01, California Regional Water Quality Control Board, San Diego Region – see attached). Specifically we advocate a bioassessment program which would consist at a minimum of station identification, sampling, monitoring, and data analysis for 20 stations in order to determine the biological and physical integrity of urban receiving waters within Los Angeles County. In addition, three reference bioassessment stations should be sampled. The bioassessment study should meet the following requirements and should be compatible with the Ambient Monitoring Program being developed by the Los Angeles Regional Board:

   i. Each urban stream bioassessment station must

      a) be located within the jurisdiction of a co-permittee;

      b) be representative of urban stream conditions within one of the five watersheds; and

      c) meet the physical criteria of the California Stream Bioassessment Procedure[1], or a modification thereof, approved by the Executive Officer.

   ii. Each urban stream bioassessment station should be monitored twice annually, in May and October. A minimum of three replicate samples should be collected at each sampling station.

[1] California Stream Bioassessment Procedure, California Department of Fish and Game, Aquatic Bioassessment Laboratory, May 1999.

iii. Sampling, laboratory, quality assurance and analysis procedures should follow the procedures in the California Stream Bioassessment Procedure. Results should be reported annually and data should be submitted to the Board electronically, formatted to CDFG Aquatic Bioassessment Laboratory specifications for inclusion in the statewide bioassessment database.

B. For "Benthic Studies", the parameters to be studied and the number and locations of samples must be specified. Benthic studies should occur at the mouths of all five major watersheds.

i. Parameters should include body burdens of 303(d) listed bioaccumulative contaminants in shellfish and fish.

ii. Population and community metrics of benthic epifauna and infauna must be determined.

iii. Sample numbers and locations should depend on the dynamics of the stormwater plume in each receiving water. Some of the sites must be within the zone of impact of the plume. If the zone of impact is not defined for a given plume, then best professional judgment should determine sampling locations. Each year, study results will determine sampling locations in subsequent years.

C. For "BMP Effectiveness Studies" in Santa Monica Bay, the number of structural and source control BMPs to be evaluated each year must be specified. Leaving this as an open ended requirement will result in an outcome similar to the last two permits: no usable information on BMP effectiveness.

2. Toxicity Testing

A. The permit must state the species to be used in water column toxicity testing, including a minimum of one marine and one freshwater species. We recommend requiring *Ceriodaphnia dubia* for freshwater monitoring because it is known to be sensitive to pesticides which are present and may be causing toxicity in stormwater. As you know, pesticides (Diazinon) have been the leading cause of toxicity in bioassays on urban runoff in a number of northern California areas. A recommendation for the marine bioassay is the sea urchin fertilization test. It is cheap to perform and sensitive to metals.

B. The sediment toxicity testing requirements must be clarified and expanded. We understand the purpose of sediment toxicity testing to determine if and where sediment toxicity exists and what the specific causes are. Therefore:

i. Clarify the "receiving waters" requirement. Does this mean in the river, in the estuary, at the fresh/salt water interface, or elsewhere? We recommend in the estuary, beginning at the region of velocity slow-down of the stormwater plume if it is known, and at the mean low tide line if plume dynamics are unknown.

ii. Sampling locations for the three sediment samples must be specified. Sampling locations should depend on the dynamics of the stormwater plume in each receiving water, and should be in areas of deposition of particles from the stormwater plume. If these areas have not been defined for a given plume, then best professional judgment should determine sampling locations in the first year of the study. The results of the first year of sampling will direct sample site selection in the following years; for example, if grain size

analysis and toxicity results indicate no settlement of stormwater particles, the sampling locations must be re-evaluated before the next sample collection.

iii. The three samples should be tested separately, not composited. We recommend spatially separated samples (for example, 100 m apart and oriented either linearly in an offshore direction, or in a fan pattern where particle settlement from the plume occurs; see 2.B.ii.). This will assist detection of toxicity and determination of causes of toxicity.

C. Total organic carbon determination and grain size analysis must accompany each sediment toxicity test.

3. Toxicity Identification and Evaluation (TIE) Studies

The TIE requirements in the draft monitoring program are not acceptable. The draft program requires a TIE when two consecutive dry-weather or three consecutive wet-weather samples show toxicity. However, only two dry-weather and two wet-weather samples are required for toxicity testing each year. This protocol will not trigger a TIE for wet weather samples in a single year. Nor will it provide sufficient information to determine causes of toxicity.

A. Since little is known about the causes of toxicity in stormwater, a TIE should be triggered whenever a single sample shows toxicity, for the life of this permit. Toxicity is indicated by an amphipod survival rate of 70% or less in a single test.

B. We recommend each TIE study utilize more than one species, because of inter-species differences in sensitivities to stormwater contaminants of concern. For example, arthropods are more sensitive indicators of pesticide toxicity while sea urchins are more sensitive indicators of impacts due to metals.

4. Constituents Exempted from Monitoring

Non-detection in 25% of samples does not justify exemption from the monitoring program. We recommend the following protocol: If a constituent is not detected over the life of the permit and MLs are below the CTR limits, then that constituent may be exempted in future permits, except for the first storm sample of the year when all priority pollutants are tested.

5. Tributary/Source Identification Monitoring

A. Are there 20 monitoring stations in total, or 20 stations per contributing watershed? We recommend basing the number of sampling stations on the number of major tributaries in each watershed, i.e. at least one station in each major tributary and the mainstem of Malibu Creek, at least one station in each major tributary and the mainstem of the San Gabriel River, etc.

B. How many samples are required per storm event? We recommend a minimum of five samples per storm if grab samples are taken, and more (duration of the storm) if an automatic sampler is used.

6. TMDL Requirements

This section was not developed. The TMDL monitoring requirements, as well as Waste Load Allocations (WLAs), should be specified in the permit. For example, on the trash TMDLs for the L.A. River and Ballona Creek, the requirement to participate in the baseline monitoring was specified, but there was no mention of the implementation monitoring requirements. We strongly recommend that all of the pertinent monitoring and implementation requirements in the trash TMDLs should be put directly in the stormwater permit.

Also, there is no mention of the other TMDL requirements that will soon kick in. For example: the Santa Monica Bay beaches pathogen TMDL should be approved by the Regional Board by the end of the year and the Malibu Creek nutrient TMDL will be before the Board this year. Both of these critical TMDLs will have implementation and monitoring requirements. The permit must require entities subject to WLAs to implement pertinent baseline implementation monitoring requirements.

7. Terminology

The terms "detection limit (DL)" and "method detection limit (MDL)" should be replaced with "minimum level (ML)" as per the State Implementation Policy (SIP).

8. Reporting Requirements

In addition to written reports, all data should be submitted electronically.

Thank you again for the opportunity to comment on Stormwater Management/Urban Runoff Discharges NPDES Permit for Los Angeles County.

Sincerely,

Mark Gold, D. Env.
Executive Director,
Heal The Bay

Shelley Luce

ATTACHMENT 1.

PART A OF THE RECEIVING WATERS MONITORING PROGRAM, FROM ORDER NO. 2001-01, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, SAN DIEGO REGION

II. Receiving Waters Monitoring Program - - Year Round

Utilizing the findings of the "Previous Monitoring and Future Recommendations Report" discussed above, the Copermittees shall collaborate to develop, submit, conduct, and report on a year round countywide or watershed based Receiving Waters Monitoring Program[2]. The goals of both the countywide and watershed based Receiving Waters Monitoring Program shall be clearly stated. The Receiving Waters Monitoring Program goals shall focus on assessing compliance with this Order, achieving water quality objectives, protecting beneficial uses, and assessing the overall health and long-term water quality trends of receiving waters. For purposes of conducting the countywide or watershed based Receiving Waters Monitoring Program, the Copermittees are encouraged to collaborate with other agencies conducting similar monitoring, such as the Southern California Coastal Water Research Project (SCCWRP), the California Department of Fish and Game, or other municipalities in Southern California. Implementation of the countywide or watershed based Receiving Waters Monitoring Program shall begin within **180 days** of adoption of this Order. The countywide or watershed based Receiving Waters Monitoring Program shall include, at a minimum, the following components:

A. Urban Stream Bioassessment Monitoring
B. Long-term Mass Loading Monitoring
C. Coastal Storm Drain Outfall Monitoring
D. Ambient Bay, Lagoon, and Coastal Receiving Water Monitoring
E. Toxic Hot Spots Monitoring in San Diego Bay

A. Urban Stream Bioassessment Monitoring

1. The Copermittees shall collaborate to develop and implement an urban stream bioassessment monitoring program. At a minimum, the program shall consist of station identification, sampling, monitoring, and analysis of data for 20 bioassessment stations in order to determine the biological and physical integrity of urban streams within the County of San Diego. In addition to the urban stream bioassessment stations, three reference bioassessment stations shall be identified, sampled, monitored, and analyzed. The selection, sampling, monitoring, and analysis of bioassessment stations shall meet the following requirements:

   a. Each urban stream bioassessment station shall be selected using the following criteria. Each urban stream bioassessment station shall:
      (1) be located within the jurisdiction of a Copermittee; or
      (2) be located within one of the nine watersheds specified in Section J, Table 4 of this Order; and
      (3) be representative of urban stream conditions within one of the nine watersheds specified in Section J, Table 4 of this Order; and
      (4) meet the physical criteria of the California Stream Bioassessment Procedure[3]; and
      (5) to the extent feasible, coincide with the location of an already existing monitoring station used by the California Department of Fish and Game in the conduct of the SDRWQCB's Ambient Bioassessment Program.

---

[2] During the first two years monitoring and reporting will be conducted and reported on a countywide basis. Beginning in the third monitoring period of Order 2001-01, the monitoring and reporting program will shift to a watershed based approach.

[3] California Stream Bioassessment Procedure (Protocol for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game – Aquatic Bioassessment Laboratory, May 1999.

b. Each bioassessment station shall be monitored twice annually, in May and October of each year, beginning in May 2001. A minimum of three replicate samples shall be collected at each station during each sampling event.

c. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized procedures set forth in the California Department of Fish and Game's California Stream Bioassessment Procedure (CSBP). Analysis procedures shall include comparison between station mean values for various biological metrics. Sampling, laboratory, quality assurance, and analytical procedures shall follow the standardized "Non-Point Source Bioassessment Sampling Procedures" for professional bioassessment set forth in the CSBP. In the event that the CSBP "Point-Source Professional Bioassessment Procedure" is performed in place of the "Non Point Source Bioassessment Sampling Procedure," justification and documentation of the procedure shall be submitted with the report. Results of the Urban Stream Bioassessment Monitoring shall be reported annually as part of the overall Receiving Waters Monitoring and Reporting Program for Order No. 2001-01. Reporting of the bioassessment data shall follow the format of the San Diego Regional Water Quality Control Board 1999 Biological Assessment Annual Report[4]. The report shall include:

(1) All physical, chemical and biological data collected in the assessment;
(2) Photographic documentation of assessment and reference stations;
(3) Documentation of quality assurance and control procedures;
(4) Analysis that shall include calculation of the metrics used in both the CSBP and the 1999 Annual Report.
(5) The report shall provide interpretation for comparisons of mean biological and habitat assessment metric values between assessment and reference stations.
(6) Utilize a regional index of biological integrity as part of the analysis.
(7) Electronic data formatted to California Department of Fish and Game Aquatic Bioassessment Laboratory specifications for inclusion in the Statewide Access Bioassessment database.

d. A professional environmental laboratory shall perform all sampling, laboratory, quality assurance, and analytical procedures. While valuable, data collected by volunteer monitoring organizations shall not be submitted in place of professional assessments.

e. Reference stations shall be selected following the recommendations in the 1999 Annual Report, Hughes (1995)[5] and Barbour et. al. (1999)[6]. Reference stations shall be evaluated annually by the Copermittees for suitability and the results included in the annual report. New reference stations will be selected as needed by the Copermittees.

---

6 Barbour, M.T., J. Gerritsen, B.D. Snyder, and J.B. Stribling (1999) Rapid Bioassessment Protocols For Use in Streams and Wadeable Rivers: Periphyton, Benthic Macroinvertebrates, and Fish. Second Edition. EPA 841-B-99-002

2. The Copermittees shall design and implement a program to conduct standardized toxicity testing at urban stream bioassessment stations where the bioassessment data indicates significant impairment. When findings indicate the presence of toxicity, a Toxicity Identification Evaluation (TIE) shall be conducted to determine the cause(s) of the toxicity.

B. Long-term Mass Loading Monitoring

For purposes of evaluating long-term trends, the Copermittees shall continue to monitor the five existing long-term mass loading stations as specified in Monitoring and Reporting Program No. 95-76 and amended by Technical Change Order Nos. 1-4. When findings indicate the presence of toxicity, a Toxicity Identification Evaluation (TIE) shall be conducted to determine the cause(s) of the toxicity.

C. Coastal Storm Drain Outfall Monitoring

The Copermittees shall collaborate to develop and implement a monitoring program for discharges of urban runoff from coastal storm drain outfalls. The program shall meet the following requirements:

1. The program shall include rationale and criteria for selection of storm drain outfalls to be monitored.

2. The program shall include collection of samples for analysis of total coliform, fecal coliform, and enterococci, in addition to any other indicators or pathogens identified by the Copermittees.

3. Samples shall be collected at both the storm drain outfall and in the surf zone (at ankle to knee water depths) directly in front of the outfall.

4. Samples shall be collected during both dry and wet weather periods.

5. Exceedances of public health standards for bacteria must be reported to the County Department of Public Health as soon as possible by the Copermittees.

D. Ambient Bay, Lagoon, and Coastal Receiving Water Monitoring

The Copermittees shall collaborate to develop and implement a program to assess the overall health of the receiving water and monitor the impact of urban runoff on ambient receiving water quality. This monitoring shall including San Diego Bay, Mission Bay, Oceanside Harbor, the Pacific Ocean coastline, coastal lagoons and estuaries, and all Clean Water Act section 303(d) water bodies or other environmentally sensitive areas as defined in F.1.b(2)(a)vii of this Order.

E. Toxic Hot Spots Monitoring in San Diego Bay

The Copermittees shall collaborate to develop and implement a program to assess the relative contribution of urban runoff on Toxic Hot Spots in San Diego Bay.

III. Submittal of Receiving Waters Monitoring Program Document

The Principal Permittee shall submit to the SDRWQCB the countywide or watershed based Receiving Waters Monitoring Program within **180 days** of adoption of this Order. The regional or watershed based Receiving Waters Monitoring Program shall describe how the Copermittees will meet the requirements of the components outlined in Section II of this Attachment

Re: Comments on Draft LARWQCB NPDES No. CAS614001 – Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles and the Incorporated Cities , Except for Long Beach and Santa Clarita

Dear Dr. Swamikannu:

On behalf of Heal the Bay, an environmental group with over 10,000 members dedicated to making Santa Monica Bay and Southern California coastal waters safe and healthy again for people and marine life, we have the following comments on the first draft L.A. County storm water NPDES permit. Although the permit is much further along than either the first draft of the 1990 or 1996 permits, we still have numerous comments and concerns about the draft permit. We believe that these and other changes should be made to the draft permit before it is finalized, and we wish to incorporate by reference the comments submitted by the Santa Monica Baykeeper and the Natural Resources Defense Council on the Draft Permit. We also incorporate by enclosure our previously-submitted comments on the Draft Monitoring and Reporting Requirements for this permit, as an addendum to this letter. Further comments on monitoring will follow once a revised monitoring plan is issued by the Regional Board.

The permit fails to truly require a watershed approach to storm water pollution abatement – The draft permit lays out a baseline storm water regulatory approach without additional watershed-specific requirements. All of the watershed groups had to prepare a watershed management area plan (WMAP) as required under the 1996 permit. However, the RWQCB failed to require implementation of these plans in order to achieve receiving water quality objectives. For example: most of the Malibu Creek watershed is listed for nutrients and fecal bacteria on California's S.303d list, yet there are no specific requirements in the permit for BMP implementation to achieve water quality objectives within the watershed. Also, there are no requirements to implement any of the watershed's WMAP. As the permit is currently crafted, achievement of receiving water quality objectives and implementation of WMAPs are unlikely to occur. Please rectify this omission by insuring that requirements for implementing watershed specific BMPs targeting water quality impairments and WMAP identified priorities are included in the permit. Watershed-specific issues were addressed and studied extensively as part of the 1996 permit. It is long overdue to include watershed-specific requirements for each of the watersheds within the storm water permit.

Definition of Environmentally Sensitive Area (ESA) – In findings on page 4 –number 6 and in definitions. Please include Environmentally Sensitive Habitat Areas (ESHAs) with receiving waters in your definition of ESAs. Los Angeles County has an extensive, ongoing

Heal the Bay
522 Nebraska Avenue
Santa Monica CA 90404
ph 310 453 0395
fax 310 453 7927
info@healthebay.org
www.healthebay.org

process using numerous scientific experts to identify and map ESHAs. The State certainly has not undergone such an extensive effort to identify and characterize the areas already included as part of the definition of ESAs. Please make the necessary addition.

The findings should include justification for the use of SIP minimum levels. This issue has been brought up by the County in discussions about monitoring requirements. SIP MLs must be included in the permit because they are the only recently developed MLs that attempt to take into consideration recent improvements in chemical analytical methods. If there were other RWQCB, SWRCB or EPA analytical methods that had more current MLs, then the use of those MLs certainly would be an option for the Board. However, there really are no sensible alternatives to the SIP MLs. Low detection limits are needed to provide information on land-use, tributary and watershed mass loadings. Until recently, PAHs were found at concentrations of concern in sediments in local estuaries, yet PAHs were not detected in runoff because of the high MLs in the analytical methods used. Use of the SIP MLs should go a long way towards eliminating this problem. Also, non-detects can't be used to accurately determine mass loadings. Finally, quantifiable data will allow the RWQCB to better assess water quality and to develop Waste Load Allocations and Load Allocations for TMDLs.

Correction of finding 23 on page 7 – Heal the Bay and the Santa Monica BayKeeper were also plaintiffs in the TMDL lawsuit against the EPA.

Since dam releases are not included in the discharge prohibition section, does that make them illegal? – The discharge prohibition section includes numerous types of dry-weather runoff discharges that are legal under the permit. However, the permit makes no mention of how to categorize occasional dry weather discharges from dams. These discharges can severely alter the natural dry-weather flow regime for a given stream segment. Also, because waters held in reservoirs and lakes behind dams often have siltation, nutrient and fecal bacteria problems, dam releases can lead to exceedances of water quality objectives downstream of the discharge. Dam releases are currently either unregulated or poorly regulated by the RWQCB. Please provide language in the permit to insure that these dry-weather runoff discharges are prohibited except as needed to prevent imminent harm to public health or property.

The draft permit does not include additional requirements for those circumstances where implementation of the revised SQMP fails to result in the abatement of violations of water quality objectives and/or standards – As the permit is written on page 14 - #4, there are no further requirements stated for permittees in the event that implementation of the modified SQMP fails to result in the abatement of violations of water quality standards and objectives. The iterative process laid out in the permit must continue until the violations are abated if the permittee still has the reasonable potential to cause or contribute to these violations. Please modify the permit accordingly.

Please add the following requirement under Part 3 B – All permittees must ensure that residents, businesses and local government properties and employees all comply with the

permittee's local storm water pollution control ordinances. Without strong local compliance assurance and enforcement programs, the ordinances will have little to no impact on storm water pollution.

Delete the MEP language in the Legal authority Section on Page 18 – The Ventura County storm water permit includes the following language: *Co-permittees shall possess the necessary legal authority to prohibit non-storm water discharges and control the contribution of pollutants to the storm drain system from storm drain discharges . . . .* For consistency purposes, the language should be the same as the Ventura County permit. In addition, any inclusion of MEP for issues such as legal authority is a complete misuse of the MEP standard. The bottom line is that the cities must prohibit illegal non-storm water discharges – period.

Also on pg. 18 – add a prohibition of discharge of sediments to the MS4. **Sediment discharges from construction and grading activities can cause major water quality and habitat degradation problems. These discharges must be prohibited.**

More specific requirements in the storm water monitoring reports should be included in the permit pg 20 –J. The annual monitoring reports should include an assessment of BMP efficacy, status and trends results for ongoing monitoring programs, loadings for each watershed, etc.

Modify Public Information and Participation Section - Pg. 21 Part 4. A – Change the third requirement to the following: To measurably change the *waste disposal and polluted runoff generation* behavior of target audiences by encouraging implementation of appropriate solutions.
Pg. 22 1b – Add "*faded or lack of catch basin stencils*" under the list of items to report to the County hotline.
Pg. 22 1c – Insert a sentence after the first sentence: *This message must remain legible during the life of the permit.*
Pg 23d – 1st sentence in the top paragraph – please add *and interested parties* after co-permittees. The public and other agencies (school districts, universities, aquaria, etc.) should be encouraged to participate in this process to strengthen educational efforts.
Also, there should be a requirement to assess program effectiveness for the in-school educational programs. An assessment of students' knowledge of storm water pollution problems and solutions before and after the program should be a permit requirement. Currently, it is difficult to assess how effective educational efforts by the County, City of L.A. and others have been.

Pg 23e – Why were PAHs omitted from the Ballona Creek, Dominguez Channel, and L.A. River target pollutants for outreach? PAHs have been problems in the sediments at the mouths of those creeks and rivers. Also, sediments should be added to the list for the Malibu Creek watershed. Mapping efforts, stream morphology characterization, and biological assessment of the watershed (macroinvertebrate Index of Biological Integrity) have demonstrated that sedimentation and erosion are major problems in the watershed. Finally –

Heal the Bay

ph 310 453 0395
fax 310 453 7927

info@healthebay.org
www.healthebay.org

outreach material should include information on pollutants and sources of concern *and source abatement measures.*

Pg 24 2a – Corporate outreach – Please add the following to the second sentence: *and those businesses that have the reasonable potential to cause or contribute to violations of water quality objectives and/or standards.* This language clarifies additional types of commercial businesses that should be targeted in the corporate outreach program.

Pg. 25 Programs for industrial/commercial inspections must be clarified. The focus of this program must be to educate industries and commercial businesses that are potential sources of storm water pollutants to receiving waters on regulatory requirements and BMPs to reduce storm water pollution. This section should be clarified as compliance assurance and enforcement of existing local ordinances. Currently, the language could be interpreted as requiring permittees to enforce state and federal regulatory requirements over and above what is required in local storm water ordinances. Also, no definition is provided as to what constitutes a commercial facility under the inspection requirement. Other than gas stations, restaurants, and automotive service facilities, only those commercial facilities that have the reasonable potential to cause or contribute violations of water quality objectives and/or standards should be included in the program. This should be clarified on **pg. 27 – 3d** as well.

Pg 27 – 4a BMP implementation clarification needed- please describe the designated minimum BMPs as approved in Resolution No. 98-08. As written, it is difficult to determine which BMPs are required for each type of business.

Pg 27 - 5 – Inspection of Industrial/Commercial sites must focus on compliance with local ordinances – Again, the point of emphasis of the section should be inspections to insure that industrial and pertinent commercial facilities are complying with local storm water ordinances. This is stated separately as a requirement under Section 6, but it should be stated as part of section 5. As part of the inspection requirements, please specify that inspectors must ask to see a SWPPP and NOI form for Phase I industrial facilities.

Pg 29 – C2 – Focus on peak flow control may not prevent down-stream erosion and sedimentation problems. Post development storm flows must mimic pre-existing conditions. Although controlling peak storm runoff discharge rates is critical to protecting stream and wetland habitat, it is by no means the only important hydrologic parameter that needs to be addressed. Maintaining a hydrograph that mimics natural conditions is the best way to prevent sedimentation and erosion. That means that flow controls should take in to account the total volume of runoff discharged from a site and when and at what magnitude the runoff is discharged from the site. Without taking the entire hydrograph into account, one may design and implement BMPs that manage the peak storm flow without abating sedimentation and erosion problems.

Pg 30-31 – The SUSMP provisions need to provide a more complete definition of ESAs. We strongly support the inclusion of ESAs and retail gasoline outlets in the SUSMP

Heal the Bay
2220 Nebraska Avenue
Santa Monica CA 90404
ph 310 453 0395
fax 310 453 7927
info@healthebay.org
www.healthebay.org

requirements. As stated previously, the ESA definition must include receiving waters within ESHAs. On a related topic (**also on pg. 47**), why was 200 feet chosen as the distance to define directly adjacent? Clearly storm flows from developed areas can impact receiving waters more than 200 feet from the site.

Pg. 32-33 – 7a – The permit requires development of site-specific mitigation plans without requiring implementation. Implementation requirements need to be added to insure that the plans are implemented and implemented effectively. **Under 7a-7** – please define outdoor animal care. Is it any stable? Commercial stable? A certain size facility? Also, please add golf courses to this list because they use enormous amounts of water, pesticides, herbicides, fungicides, and fertilizers.

Pg. 34 – 10 – The mitigation funding section must be clarified. A definition needs to be provided of a waiver for impracticability. Other than geologic hazard and very high groundwater, what development would merit a waiver? Also, wouldn't the waiver only apply to the infiltration requirement of the SUSMP? One can always provide some level of treatment for runoff coming off site. When a permittee can opt for helping to fund a regional solution and the process by which the funding amount will be determined and the project deemed an acceptable alternative must be clarified in the permit.

Pg. 35 – 14a – Please specify what the RWQCB is requiring in development planning guidelines. Without specific minimum guideline requirements, the development planning guidelines will likely be ineffective.
14b-2 – add *of discharge* after duration.

Pg. 37 – D2 – Programs for Construction sites. **Strike out *that* and replace with *everything* in the first sentence.**
D2d – Add – *sediments shall not be discharged to MS4 or receiving waters.*
D2e – Add *or receiving waters*
D2g – Add – *Grading during the wet season shall be strongly discouraged, limited or prohibited. Justification for the need to grade in the wet season must be provided to the permittee. All erosion-susceptible slopes **must** be covered, netted or planted during the wet season.*

Pg. 39 – D4a – Why is the "one acre or greater" NOI and SWPPP requirements in this section instead of section D2?

Pg. 40 –E2 – In the event of chronic poor beach water quality (high fecal bacteria densities) near a storm drain, what is required of permittees that may have been the source of the contamination? High bacteria densities in storm drains may be due to illegal discharges, illicit connections or leaky sewer lines, so the question is pertinent for this section. When beaches have chronic problems, the permittee must be required to implement a sanitary survey to determine the likely sources of beach contamination. Also, the permittee must

Heal the Bay
3220 Nebraska Avenue
Santa Monica CA 90404
ph 310 453 0395
fax 310 453 7927
info@healthebay.org
www.healthebay.org

revise the SQMP and implement appropriate BMPs to abate the water quality problem as soon as possible.

Pg. 42 – E4 – Please add the following prohibitions for landscape and recreational facilities management – *Use of banned pesticides, herbicides, rodenticides and fungicides is prohibited. Disposal of landscape waste in the MS4 and receiving waters is prohibited. The storm water monitoring program must analyze runoff samples for all pesticides, herbicides, rodenticides and fungicides that are used by public agencies.*

Pg. 43 – E5a – Please add the following language - *Catch basin inspection procedures shall include an assessment of the legibility of the catch basin stencil. Illegible stencils must be restenciled within one year of inspection.*
E5e – Please provide greater specificity on the requirements. Do you want the permittees to give you the total annual volume of waste collected from catch basins or do you want the volume by catch basin cleaning route? Or the volume per basin per year? Or the volume per basin per cleaning?
Storm Drain Maintenance – the second E5 needs modifications as well.
E5a – Lack of specificity - All open channels should be visually inspected on at least an annual basis.
E5b – Please clarify.
E5c – Please add a requirement to quantify the annual volume or mass of trash removed per stream segment through the storm drain cleaning program.

Pg. 44 – 6b – The parking lot cleaning and inspection requirements must be clarified. Based on the permit language, it appears as if parking lots may never need to be cleaned. Twice monthly inspections can be performed in lieu of any cleaning. No specificity is provided in the permit on parking lots must be cleaned. (sentence doesn't make sense) Even with inspections, the permit must include a minimum level of parking lot cleaning. For example – *Under no circumstances can parking lots be cleaned less than once per 30 days during the dry season, or less than once per 30 days during dry periods of 30 days or more during the wet season.*

Pg. 44-45 – The program to eliminate illicit connections and discharges does not include quantifiable requirements. All storm drains should be inspected over the life of the permit. We suggest the following monitoring frequency: *All open channels shall be inspected no less than annually. All commercial and industrial storm drains shall be inspected at least once every three years. All problem drains (based on past inspections and historic number of illegal discharges and illicit connections) must be inspected on an annual basis. All remaining drains shall be inspected at least once over the life of the permit.*
As part of the IC/ID program, each permittee should be required to review existing and historic local storm drain connection and or discharge permits given to businesses. The permittee should determine which, if any, non-storm water discharges are authorized under the existing storm water NPDES permit requirement. Those facilities that do not have a valid

info@healthebay.org
www.healthebay.org

permit for a legal non-storm water discharge must be forced to cease discharge within 30 to 60 days, or obtain an NPDES permit.

Pg 45 F2b – The priority screening section should be strengthened and clarified. Requirements need to be included in the permit section on how prioritization must occur. Should land use be considered? EMCs based on land uses? County mass loadings data? Source identification and/or critical source monitoring? Also, why are the 1994 Northridge quake and the 1992 civil unrest relevant to this permit seven to nine years later?

Pg 46 F2d – Illicit connection termination. Delete the second sentence because it isn't necessary. Clearly, the RWQCB's intent on this section is to insure that illicit connections are eliminated as quickly as possible, not to enforce against a municipality that is making a good faith effort to enforce ordinance requirements to eliminate illicit connections.

Add the TMDL section that is included in the Ventura County Storm Water Permit. The language from the permit was as follows: *The permittee shall modify the Ventura County Stormwater Management Plan to comply with waste load allocations developed and approved pursuant to the process for the designation and implementation of TMDLs for impaired water bodies.*

If you have any questions about our comments, please don't hesitate to call Mark Gold at 310-453-0395 x119.

Sincerely,

Mark Gold

Re: Comments on Los Angeles County Municipal Storm Water Permit Draft One

Dear Dr. Swamikannu:

On behalf of over 400,000 NRDC members, including approximately 50,000 who reside in Southern California, the Natural Resources Defense Council appreciates the opportunity to provide comments on the first draft of the 2001 Los Angeles County NPDES Municipal Storm Water Permit ("Draft Permit").

After reviewing the document, there is little question that Regional Board staff have worked hard to produce this Draft Permit. Given the complexity and length of the permit, however, we nevertheless have a number of comments and serious concerns that are addressed below. We believe that these and other changes should be made to the Draft Permit before it is finalized. In this connection, we wish to join in (and thus incorporate by reference) the comments submitted by the Santa Monica BayKeeper and Heal the Bay on the Draft Permit.

Imprecise characterization of Clean Water Act Section 402(p) requirements. Our first comment concerns loose references to the legal requirements imposed by applicable legal authority throughout the Draft Permit. For example, Paragraph 16 on page 6 of the Draft Permit states that the intent of the Draft Permit is to "minimize the discharge of pollutants in storm water." Likewise, the intent of the Draft Permit is

www.nrdc.org 6310 San Vicente Boulevard, Suite 250

TEL 323 934-6900 FAX 323 934-1210

NEW YORK · WASHINGTON, DC · SAN FRANCISCO

described (Paragraph 43, Page 10) as assuring that discharges do not "cause" excursions of water quality standards. Furthermore, the Draft Permit mistakenly provides that non-storm water discharges must be prohibited to the maximum extent practicable. Draft Permit at 18. *See also* Draft Permit at 19 (omitting MEP standard); *Id.* at 56 (omitting permittees from the standard provision regarding "Duty to Comply").

While Staff's intent to track Clean Water Act requirements may be inferred from these aspects of the Draft Permit, each of these statements nevertheless fails to convey the exact nature of the legal requirement, often understating them. Legally, the Permit must, among other things, result in a reduction of pollutants in storm water to the maximum extent practical, and assure that discharges neither cause nor contribute to the exceedence of water quality standards, and absolutely prohibit non-storm water discharges. 33 U.S.C. Section 1342; 40 U.S.C. Section 122.26. Given the contentious approach to storm water management taken by some permittees, it is imperative that legal requirements be precisely and plainly stated throughout the Permit. We recommend that staff counsel correct the problems identified above and also thoroughly review the Draft Permit with these concerns in mind. We further believe that these legal requirements must be plainly stated as Permit limitations, and not simply set forth in the definitions or findings.

Incomplete Discussion of Nature of Discharges and Sources of Pollutants. Recent monitoring conducted by the County of Los Angeles, and referenced in the Draft Permit, provides important information on pollutants of concern in local storm water discharges. However, these data are not the only sources of information on pollution sources or impacts caused by Southern California's urban runoff problem. Many other agencies and institutions, ranging from the University of California to the Southern California Coastal Water Research Project, have documented severe receiving water impacts caused by storm water and non-storm water discharges and ranging from toxicity to viral detection in the surf zone. Many of these facts—including storm water's status as the largest source of pollutants to the coastal environment—are documented in NRDC's

Petition to the United States EPA for Correction of Legal Deficiencies or Withdrawal of EPA Approval (2000) ("NRDC Petition"), of which the Board is well aware. We incorporate that information herein by reference and ask that those undisputed facts be added to the section of the Permit entitled "Nature of Discharges and Sources of Pollutants" (Page 3).

In addition, given the fact that storm water is the largest source of many pollutants to local waters, in every instance in which a water body is listed as impaired pursuant to the State of California's 1998 Section 303(d) list, the impairing pollutant must be considered "priority," as that term is used in Finding 2, Page 3 of the Draft Permit. (This is because the finding of impairment constitutes a corollary recognition that the discharge of additional loadings of the impairing constituent presumptively exceeds the carrying capacity of the waterway at issue. This fact assures that additional discharges will cause or contribute to the violation of a water quality standard.)

No Basis for Approval of the SQMP & Delayed Compliance Requirements. We are unsure why the Draft Permit refers to the SQMP as being "acceptable." Draft Permit at 5. There are no findings in the permit to support this statement. Indeed, the Draft Permit would require changes to significant aspects of the SQMP, thereby precluding the possibility that it is now adequate. *Id.* Indeed, given that the Draft Permit appears to be predicated on the assumption that faithful implementation of the SQMP may constitute compliance with the Permit itself, the Permit must justify the consistency of the SQMP with Clean Water Act requirements, including MEP. Presently, we could not find any discussion of this matter, although it is extremely important.

In this connection, the Draft Permit would repeat the seriously flawed approach followed in 1996 by requiring that aspects of the management plan be made adequate after the Permit is issued (generally within 180 days). Not only does staff's experience prove that this date will inevitably slip, as it did routinely with respect to nearly every

requirement imposed as a part of the 1996 permit (*see* NRDC Petition), but this approach does not assure that an adequate storm water program will be implemented concurrent with the issuance of the permit itself. In fact, the Draft Permit only requires permittees to implement the management plan after it is approved by the Executive Officer, sometime after the Permit is itself issued. *See, e.g.*, Draft Permit at 17. In some instances, compliance with extremely basic BMPs is deferred until mid-2003. *See* Draft Permit at 22 (no dumping signs). Given that this is the third iteration of the municipal permit, there is simply no justification for such extraordinary delays especially as applied to the most basic storm water control actions.

The only legal way by which the Board can impose a legal requirement but delay the date of compliance is to issue a time schedule order ("TSO") under the Clean Water Act. Here, however, there is clearly no basis for the issuance of a TSO, especially given the explicit requirement for the Report of Waste Discharge to contain the storm water management plan to be implemented under the permit and the fact that the permittees have been obligated to comply with storm water regulations since 1990. 40 C.F.R. Section 122.26(d)(2)(iv). We know that many permittees are pressuring staff to make these sorts of concessions, but it is now past the time when delays such as these are even arguably appropriate.

Specification of Responsibilities and Loopholes. While it is permissible for a permit covering multiple entities to contain a delineation of responsibilities, we are concerned that the Draft Permit fails to explicitly make each co-permittee responsible for the adequacy of the SQMP. *See* Draft Permit at 15. There is no provision of the Clean Water Act that can deflect the legal responsibility of each permittee to design and inplement a storm water management program that reflects Clean Water Act requirements. We request that the Draft Permit be clarified to underscore that, notwithstanding the complicated administration structure that the permittees have chosen to create (*e.g., EAC and WMIs)*, each permittee bears individual responsibility to assure

program adequacy within its respective jurisdiction. *See* Draft Permit at 14 (describing duties of County of Los Angeles and "EAC"). This includes the duty to assure that the program designed is adequate and that, thereafter, it is fully implemented.

Furthermore, language that now provides that permittees have a duty to implement the Permit "in an efficient and cost-effective manner," and that appears to contain other limitations or exceptions ("a permittee is required to comply with the requirements of this Order applicable to discharges which originate from places within its boundaries over which it has authority to enforce the requirements of this Order") are similarly inconsistent with the Clean Water Act and its implementing regulations. Much of this section of the Draft Permit appears to contain the germs of arguments that some of permittees intend to use in the future to deflect responsibility for complying with the Permit. These sections are unlawful.

In these respects, it is critical to emphasize that the issuance of individual permits to each permittee is a viable alternative that would eliminate the complicated administrative and logistic apparatus that plagues the Draft Permit. These provisions threaten to result in the same foot-dragging that doomed the Regional Board's efforts to implement the 1996 Permit.

Adequacy of Enforcement and Audits. As staff know, due to severe under-funding the Regional Board's enforcement and audit program for municipal entities has been virtually non-existent during the last ten years. This violates the terms the State of California's agreement with the United States Environmental Protection Agency allowing the Regional Board to implement this NPDES permit program—and is also a violation of the Clean Water Act. *See* Storm Water Program Five-Year Work Plan at V-9 (State of California, 1994; NRDC Petition at 22-24.

While recent budget augmentations have significantly improved Regional Board capacity, it is unclear whether the Regional Board can meet its own minimum inspection and audit requirements for each municipal entity during each year of the term of the new Permit. Does the Board intend to meet these requirements and, if so, how will it do so?

It is NRDC's position that the Regional Board's approval of the new permit would be unlawful unless the Board articulates a reasonable basis to believe that it will comply with the annual inspection and audit requirements, including onsite visits to each permittee each year. While the permit will impose obligations on many cities, issuance of the Permit imposes obligations on the Board, including those that arise as a function of California's agreements with EPA. *See* Draft Permit at 7 (Finding 22, discussing delegation of authority by EPA to the State of California and Regional Board.) Based on information compiled in the NRDC Petition, it is clear that the Board has never before met these requirements. If the Board were to approve the Permit without the ability or intent to enforce it, the Board's action—which must comply not only with the substantive provisions of the Clean Water Act but also with the general legal provisions that apply to any agency action—would violate the Clean Water Act and also constitute an abuse of discretion. California Code of Civil Procedure Section 1094.5(b).

Furthermore, unless the Regional Board can demonstrate capacity that will allow it to meet the terms of the State's agreement with EPA regarding implementation of the NPDES program, the EPA would have no choice but to object to and disapprove the Permit. EPA has a responsibility to assure not only that the terms of NPDES permits meet basic Clean Water Act requirements but also that they are administered by state agencies that possess the capacity to meet basic enforcement requirements. As discussed in the NRDC Petition, these requirements are set forth both in EPA regulations and policy and also in state workplans, administrative procedure manuals, and other formal documents on which EPA delegation is based.

SUSMP Requirements. We are pleased to see that the Draft Permit expands the SUSMP to encompass environmentally sensitive areas, gas stations, and ministerial projects. We believe the SUSMP should be further expanded to cover municipally-owned maintenance and other related facilities. There is no reason why municipal governments should not have to assure that these sources of storm water pollution are covered by appropriate structural controls. In addition, site specification mitigation requirements (Draft Permit at 32-33) should also cover parking lots smaller than 25 spaces, for all of the reasons that support inclusion of larger parking lots in the SUSMP numerical treatment/infiltration requirements.

Thank you for the opportunity to provide comments on this important proposed permit. Please feel free to contact me if you have any questions.

Sincerely,

David S. Beckman

Re: Los Angeles County Municipal Storm Water Permit Renewal

Dear Mr. Dickerson:

Santa Monica BayKeeper submits the following comments regarding the draft Municipal Storm Water Permit for Los Angeles County and 83 local cities. We also hereby incorporate by reference those comments submitted by the Natural Resources Defense Council and Heal the Bay on this matter.

THE NATURE OF THE PROBLEM

As this Board is well aware, urban runoff is a significant problem for local surface waters. This information is highlighted in the In Re Petition of Natural Resources Defense Council for Correction of Legal Deficiencies or Withdrawal of Stormwater Program Administered by the Los Angeles Regional Water Quality Control Board, on file with the Board [1]

STORM WATER DISCHARGES CANNOT AND SHOULD NOT CAUSE OR CONTRIBUTE TO EXCEEDANCES OF WATER QUALITY STANDARDS OR WATER QUALITY OBJECTIVES.

BayKeeper agrees that storm water discharges cannot cause or contribute to exceedances of water quality standards. See, e.g. In re the Matter of Environmental Health Coalition, SWRCB Order No. 98-11 (January 22, 1998). Nonetheless, many cities make much of the claim that the Clean Water Act, according to the Ninth Circuit decision in Defenders of Wildlife v. Browner, does not mandate inclusion of numeric effluent limits in municipal storm water permit. Instead, the court found these limits are discretionary with EPA and the states. However, what the cities are missing is the fact that the State already decided that storm water discharges would be subject to certain effluent limits and receiving water objectives (see e.g., LA Basin Plan, CA Ocean Plan). This regional board cannot now ignore these state regulations, as the permittees seem to want.

Re: Los Angeles County Municipal Storm Water Permit Renewal

Dear Mr. Dickerson:

Santa Monica BayKeeper submits the following comments regarding the draft Municipal Storm Water Permit for Los Angeles County and 83 local cities. We also hereby incorporate by reference those comments submitted by the Natural Resources Defense Council and Heal the Bay on this matter.

THE NATURE OF THE PROBLEM

As this Board is well aware, urban runoff is a significant problem for local surface waters. This information is highlighted in the In Re Petition of Natural Resources Defense Council for Correction of Legal Deficiencies or Withdrawal of Stormwater Program Administered by the Los Angeles Regional Water Quality Control Board, on file with the Board.[1]

STORM WATER DISCHARGES CANNOT AND SHOULD NOT CAUSE OR CONTRIBUTE TO EXCEEDANCES OF WATER QUALITY STANDARDS OR WATER QUALITY OBJECTIVES

BayKeeper agrees that storm water discharges cannot cause or contribute to exceedances of water quality standards. See, e.g. In re the Matter of Environmental Health Coalition, SWRCB Order No. 98-11 (January 22, 1998). Nonetheless, many cities make much of the claim that the Clean Water Act, according to the Ninth Circuit decision in Defenders of Wildlife v. Browner, does not mandate inclusion of numeric effluent limits in municipal storm water permit. Instead, the court found these limits are discretionary with EPA and the states. However, what the cities are missing is the fact that the State already decided that storm water discharges would be subject to certain effluent limits and receiving water objectives (see e.g., LA Basin Plan, CA Ocean Plan). This regional board cannot now ignore these state regulations, as the permittees seem to want.

---

[1] We hereby incorporate by reference the Petition as well as the referenced materials on water quality impairment.

ALL NEW MUNICIPAL STORM DRAINS SHOULD MEET WATER QUALITY STANDARDS BEFORE INSTALLATION

According to 40 CFR 122.4(i), with limited exception, "No permit may be issued... to a new source or a new discharger, if the discharge from its construction or operation will cause or contribute to the violation of water quality standards." The Regional Board has largely ignored this requirement. Nonetheless, BayKeeper believes at a minimum that this permit should require municipalities to demonstrate that new storm drains will not cause or contribute to exceedances of water quality standards. We believe that this determination should be made before any new drains are allowed. We suggest the following language.

> *Discharges from a new stormwater outfall, constructed after the issuance of this permit, shall not cause or contribute to a violation of applicable water quality objectives. Copermittees shall demonstrate compliance with this requirement before construction of such outfall commences by submitting to the Regional Board, prior to construction, documentation evidencing how compliance will be achieved and any water quality data to support such claims.*
>
> *For purposes of this permit, a new stormwater outfall means an outfall that is constructed at a location where a municipal separate stormwater discharge did not previously exist. For purposes of this permit, the point of compliance for discharges from a new stormwater outfall is in the naturally-occurring or man altered surface water body at the point of discharge.*

We also believe this to be fully consistent with the Regional Board's receiving water approach, although it provides clarity to ensure protection before a pipe is installed.

MEP IS NOT A PROPER LIMITATION ON CONTROLS FOR NON-STORMWATER DISCHARGES

Page 18 of the permit requires permittees to possess the necessary legal authority to prohibit non-stormwater discharges "to the maximum extent practicable." This is inconsistent with the existing MS4 permit (see page 11), the proposed permit (see page 12) and the Clean Water Act. In particular, 33 U.S.C. Section 1342 (p)(3)(B)(ii) requires permits for discharges from municipal storm systems to "include a requirement to effectively prohibit non-stormwater discharges into the storm sewer." There is no mention of MEP in this requirement, as the MEP component of the municipal storm water provision is found in the next subsection, 33 U.S.C. Section 1342 (p)(3)(B)(iii). For this reason we recommend the following language in place of the proposed language.

> *Co-permittees shall possess the necessary legal authority to prohibit non-storm water discharges and control the contribution of pollutants to the storm drain system from storm drain discharges.*

THE SUSMP REQUIREMENTS MUST ABSOLUTELY PROHIBIT DISCHARGES TO AREAS OF SPECIAL BIOLOGICAL SIGNIFICANCE.

Under the current proposal, the definition of Environmentally Sensitive Areas (ESAs) includes Areas of Special Biological Significance (ASBS) for regulation under the SUSMP requirements. See Proposed Permit pages 32 and 48. BayKeeper is fully supportive of protecting-ESA's. However, we believe that ASBS discharges are afforded absolute protection from storm water discharges. Indeed, as the Board is fully aware, the Ocean Plan, for nearly three decades, has contained an absolute prohibition on discharges of waste, including stormwater, to ASBSs. See e.g. SWRCB Order No. 2001-08 (April 26, 2001) (Upholding the Ocean Plan discharge prohibition for Caltrans stormwater discharges to an ASBS in Orange County). Thus, the SUSMP provision, as written, could lead to violations of this requirement. For the reasons discussed below, we therefore recommend the following SUSMP language change:

> *Stormwater or dry weather urban runoff discharges to ASBSs are absolutely prohibited.*

The California Ocean Plan ("Ocean Plan" or the "Plan") is a statewide water quality control plan for ocean waters. SWRCB, 1997 California Ocean Plan, Water Quality Control Plan for Ocean Waters of California (July 23, 1997).[2] Fundamentally, it reflects the view of the State Board that the "protection of the quality of the ocean waters for use and enjoyment by the people of the State requires control of the discharge of waste to ocean waters . . . " Id. at 1.

The Ocean Plan was first adopted in 1972 to establish policies for the discharge of waste to the Ocean. The Ocean Plan is authorized by sections 13000 and 13170 of the Porter-Cologne Water Quality Act ("Porter-Cologne Act" or "Water Code"). The Ocean Plan was adopted to comply with section 303 of the federal Clean Water Act, which requires the adoption of water quality standards for all interstate and intrastate navigable waters. 33 U.S.C. § 1313; Cal. Water Code § 13170. Navigable waters, as defined by the Clean Water Act, include the territorial seas. 33 U.S.C. § 1362(7).

Since its inception, the Ocean Plan has applied to most sources of water pollution, including stormwater discharged through pipes and other channels. The first version of the Plan, issued in 1972, contained very limited exceptions for vessel wastes and dredging (and the disposal of dredging spoils). In fact, these are the only exceptions that have ever existed in the Ocean Plan. Thermal control was the subject of a companion water quality control plan, which was adopted on May 18, 1972. SWRCB, Water Quality Control Plan for Ocean Waters of California (July 6, 1972) at 10.

---

[2] True and correct copies of source documents (other than cases, statutes and regulations) are attached as exhibits to "Declaration of Heather L. Hoecherl in Support of Response to Petition of Department of Transportation," filed herewith.

In 1978, the State Board updated the Ocean Plan "after an extensive review . . ." SWRCB, Resolution No. 78-2 (January 19, 1978). In the updated Plan, the Board elaborated on the applicability of Ocean Plan requirements by providing that "[t]his Plan is applicable, in its entirety, to point source discharges to the Ocean." SWRCB, Water Quality Control Plan for Ocean Waters of California (1978) (reprinted in February 1981) at 10. The 1978 Ocean Plan further noted that non-point discharges were subject to most of the Plan's provisions, including its Chapter V discharge prohibitions, such as the prohibition applicable to Areas of Special Biological Significance. Id.

The State Board's intent in making this change underscores the broad scope of the Ocean Plan from its earliest versions in the 1970s. CEQA documentation associated with the 1978 update to the Plan states that, because of the limited exceptions contained therein, "it is logical to assume that unless specifically excluded the plan is applicable to non-point sources, including diffuse storm drainage." SWRCB, Initial Study to Describe the Environmental Impact of Proposed Amendments to the "Water Quality Control Plan for Ocean Waters of California" (January 19, 1978) ("1978 Negative Declaration") at 26-27. While the classification of stormwater as a point source was settled once and for all in 1987 by the United States Congress, the use of the phrase "diffuse storm drainage" to elucidate the term "non-point sources" indicates an earlier recognition by the Board that some stormwater discharges, such as those carried through a conveyance, were properly considered a "point source" of pollution. Nonetheless, the Ocean Plan prohibition applies to both point sources and non-point sources.

For this reason, we feel the permit should not include ASBSs in the SUSMP numeric design criteria. Rather, the permit should recognize the long-standing prohibition on discharges to ASBSs.[3]

A PERMIT SHOULD NOT BE ISSUED UNLESS AND UNTIL THE PERMITTEES DEMONSTRATE THEY CAN AND WILL FULLY ENFORCE LOCAL ORDINANCES AGAINST INDUSTRIAL FACILITIES.

A number of cities have raised concerns about the provisions for industrial and commercial inspection and enforcement programs contained at pages 25-28 of the proposed permit. Some cities have gone so far as to state that they do not have the legal ability to do what is requested of them under this section. BayKeeper is very troubled by these statements, particularly given the fact that these municipalities have had nearly 10 years to address these sources of pollution and have done little.

Meanwhile, the federal regulations make very specific legal authority requirements in the stormwater permit *application process*. In particular, the federal regulations, at 40 CFR 122.26 (d)(2), state

[3] We hereby incorporate by reference the comments provided to the state board in *******

(2) "Part 2. Part 2 of the application shall consist of:

(i) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance, or series of contract which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by stormwater discharges associated with industrial activity and the quality of stormwater discharged from sites of industrial activity.

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal storm sewer;

(C) Control through ordinance, order or similar means, the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than stormwaters;

(D) Control through interagency agreements among co-applicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspections, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer." (Emphasis added)

In addition, federal regulations also require as part of the application process, "[a] description of a program to monitor and control pollutants in storm water discharges to municipal systems from ...industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system." 40 CFR 122.26(d)(2)(iv)(C) (Emphasis added). Similar provisions exist for construction inspection and enforcement programs. See e.g. 40 CFR 122.26(d)(2)(iv)(D).

Clearly, the regulations never intended to allow continued and ongoing programs to focus exclusively on education, as the permittees seem to desire. Instead, the only logical conclusion is that the municipalities must cooperate in enforcing industrial stormwater programs, through their local ordinance authority. For them to suggest that they do not have that authority simply demonstrates that they have not complied with the Part 2 application process.

Moreover, if the cities' argument is that the Regional Board does not have the authority to issue a permit with new conditions requiring inspection, then to a certain extent we would agree. However, we do so because of the fact that no permit at all can be issued where the city does not demonstrate that they have the authority in the first place. It is not the responsibility of the Regional Board to include such a provision in the permit. Rather, it is

the responsibility of the cities, should they desire a permit to discharge to Waters of the United States, to demonstrate -- in advance of the issuance of a permit -- that they have the legal authority necessary under the federal regulations in order to receive a permit. The cities have clearly failed to do so and thus a permit should not be issued until such assurances are provided.

THE PERMIT SHOULD INCLUDE RETAIL GASOLINE OUTLETS UNDER THE STANDARD URBAN STORM WATER MITIGATION PLAN.

BayKeeper is very supportive of including Retail Gasoline Outlets (RGOs) in the SUSMP numeric design provisions. We agree with staff findings Number 11 and 12 that "studies indicate that facilities with paved surface subject to frequent motor vehicle traffic (such as parking lots and fast food restaurants) or facilities which perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in stormwater." (citation omitted).

Moreover, we remain unconvinced by many of the arguments presented to the State Water Board last year by WSPA regarding potential hazards from treatment or infiltration devices at RGOs.[4]

In particular, representatives of WSPA claimed, among other things, that there would be a "risk of explosive gases building up in an underground vault" and thus SUSMP numeric design provisions should not apply to RGOs. Mr. Welch, an attorney for WSPA stated that "if you had a leak that gets in there and a car drives up, you could have an explosion." Transcript of SWRCB Proceedings at 214 (June 7, 2000). In addition, Mr. Timothy Simpson, a consultant for WSPA, testified that "from a practical perspective, any device that's going to collect run-off is also going to collect any spilled product, which can create a significant explosion hazard and make it much more difficult to clean up spills when they do occur." Transcript of Proceedings at 234. Moreover, Mr. Wilkness testified "by not requiring a treatment device that has an underground structure, you don't have this problem." Transcript of Proceedings at 218.

In light of this testimony BayKeeper conducted a general survey of RGOs in the region to identify if in fact the RGO industry as a whole has addressed these types of concerns in the design and construction of their own facilities.

As part of this survey, BayKeeper identified over 100 RGOs in the area with storm drain inlets or other open-air underground drainage structures on RGO properties. Attached hereto as Exhibit I are several hundred true and correct color photographs identifying the location of such stations as well as the actual storm drain inlets on the RGO property itself. This information directly contradicts the testimony of WSPA's representatives at

---

[4] We hereby incorporate by reference the entire administrative record in the SUSMP proceedings, including the numerous comment letters provided by the environmental community as well as the testimony at the various regional and state board hearings.

the State Board hearing. Moreover, WSPA's testimony is astonishing given the fact that BayKeeper investigators identified underground drainage inlets immediately under some RGO canopies, exactly where cars are fueling. (See e.g. photographs for stations at pages 5, 8, 9,10, 25).

At a minimum, this information makes it clear that subterranean drainage systems are common at RGOs and that some types of structural treatment BMPs (such as storm drain inlet filters) are safe for RGOs. At best, it obliterates WSPAs entire argument about the risks of underground structures at RGOs. It also seems clear that WSPA representatives conceded the fact that some structural BMPs may not cause risk of explosion is point during cross examination of Mr. Wilkness by Mr. Helperin:

"Q. (by Mr. Helperin): All I'm trying to establish is that the two types of BMPs that you discussed as being problematic [sand filters and compost filters], those problems don't necessarily apply to many of the other types of BMPs that are available to an RGO, is that right?"

A. (by Mr. Wilkness): Those particular problems, yes."

See Transcript of Proceeding at 97. (June 8, 2000).

Finally, the SUSMP continues to have a provision to protect groundwater quality for other types of infiltration BMPs. We see no reason whatsoever to exempt RGOs from the numeric design requirements.

THE ILLICIT CONNECTION AND DISCHARGE PROGRAM SHOULD BE STRENGTHENED.

BayKeeper recently learned that the City of Los Angeles, and potentially many other cities, issued permits for stormwater or other discharges to the MS4 for several decades. In the City of LA, thousands of permits were issued before and after the MS4 NPDES program came into existence. In light of this, BayKeeper believes all cities should undertake similar efforts to the City of LA to ensure that these types of discharges do not violation the discharge prohibitions of the permit. This should include a review of all past city permits authorizing any discharges to the MS4. If the discharge is not categorically exempt under the MS4 permit, then the discharge must immediately cease or the discharger must obtain an individual NPDES permit from the Regional Board

THE PERMIT SHOULD HAVE IMPLEMENTING LANGUAGE FOR TMDLS.

While we believe that all present and future TMDL requirements are applicable to stormwater discharges as point sources, we feel it would be helpful to include express provision to TMDL compliance in this permit. We suggest the following additional language

The permittees shall comply with applicable waste load allocations developed and approved for TMDLs for impaired water bodies.

THE ECONOMICS OF STORM WATER POLLUTION WARRANT STRONG WATER QUALITY PROTECTION

If dischargers are going to insist on economic considerations for NPDES permits (a position that BayKeeper believes is contrary to federal and state law, but one that the board regularly seems to consider), we request that you consider prior economic conclusions that demonstrate the enormous economic importance of clean water. These documents include, among the others, evidence from EPA as set forth in the 305(b) Report to Congress (Chapter 9) - http://www.epa.gov/305b/98report/toc.html, EPA's Liquid Assets 2000 (chapters: Executive Summary and "The Business of Clean Water," - http://www.epa.gov/ow/liquidassets/), and the economic considerations from the California Toxics Rule, Federal Register: May 18, 2000 (Volume 65, Number 97)Page 31705

WE SUPPORT GENERAL PLAN UPDATES

BayKeeper is very supportive of requiring general plan updates to reflect storm water requirements. For too long, many of these plans have not included a comprehensive discussion of water quality, let alone provision to comply with water quality requirements. With the upcoming County and City of LA revisions, now is the time to address these issues.

THE PERMIT SHOULD CONTAIN SOME ADDITIONAL FINDINGS.

BayKeeper believes that evidence in the record supports inclusion of the following in the "Findings" portion of the proposed permit:

- Urban Runoff is a waste and a point source discharge of pollutants: Urban runoff is a waste, as defined in the California Water Code, that contains pollutants and adversely affects the quality of the waters of the State. The discharge of urban runoff from an MS4 is a "discharge of pollutants from a points source" into waters of the United States as defined in the Clean Water Act. (Language identical to San Diego Municipal Storm Water Permit, SDRWQCB Order No. 2001-01 at p. 1).

- Urban Development Increases Pollutant Load, Volume, and Velocity of Development: During Urban Development two important changes occur. First, natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants providing a very effective natural purification process. Because pavement and concrete can neither absorb water nor remove pollutants, the natural purification characteristics of the land are lost. Secondly, urban development creates

new pollution sources as human population density increases and brings with it proportionally higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc. which can either be washed or directly dumped into the MS4. (Language identical to San Diego Municipal Storm Water Permit, SDRWQCB Order No. 2001-01 at p.2).

Thank you for the opportunity to comment on this draft permit. If you have any questions or comments, please do not hesitate to contact me.

Sincerely,

Steve Fleischli

June 15, 2001

Mr. Xavier Swamikannu
California Regional Water Quality Control Board
Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

RE: WSPA Comments on the April Draft NPDES Stormwater Permit for Los Angeles County (NPDES No. CAS614001)

Dear Mr. Swamikannu:

The Western States Petroleum Association ("WSPA") appreciates the opportunity to submit comments on the Regional Board's April 13, 2001 Draft Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges in Los Angeles County (NPDES No. CAS614001) (the "Draft Permit"). WSPA is a trade association representing approximately thirty companies engaged in all aspects of the exploration for, production, refining, transportation and marketing of petroleum and petroleum products in the Western United States. WSPA is concerned that the requirements affecting retail gasoline outlets (RGOs) in the Draft Permit will impose significant unnecessary costs and expenses on WSPA members, will not result in a demonstrable environmental benefit, and may, in fact, cause unintended harm to the environment.

Due to WSPA's prior involvement with the Los Angeles Standard Urban Stormwater Mitigation Plan (SUSMP), we were surprised that WSPA was not provided any notice of the April workshop or of the May 16, 2001 comment deadline until after the fact. On June 8, 2001, Wendy Phillips of your office apologized for this oversight. She invited us to submit comments on the Draft Permit by June 15 and promised that such comments would be included in the administrative record. We appreciate Ms. Phillips' offer to accept WSPA's comments and include them as part of the record in this proceeding.

In addition, on June 12, 2001 we received a "Technical Report" prepared jointly by staff of the Los Angeles and San Diego Regional Boards which discusses the proposed design standards for RGOs. We understand that any comments on the Technical Report must be submitted by August 6, 2001 to be included in the administrative record. We intend to provide additional comments concerning that document at a later date and reserve the right to supplement or amend these comments based upon our review of the Technical Report.

COMMENTS

1. **Stormwater Pollution at RGOs is Best Controlled By Implementation of the Task Force BMPs.**

WSPA is convinced that the best means to control any stormwater pollution at retail gasoline outlets is through the implementation of the best management practices (BMPs) for retail gasoline outlets published by the California Stormwater Quality Task Force in March 1997 (the "Task Force BMPs"). The Task Force BMPs were developed specifically for retail gasoline outlets by the California Stormwater Quality Task Force, an advisory body comprised of stormwater regulatory agencies. The Task Force BMPs are available on the Internet at the California Stormwater Quality Task Force's website www.stormwatertaskforce.org. The stated purpose of the Task Force BMPs is to assist municipal agencies and retail gasoline outlets in attaining compliance with storm water regulations. By controlling potential sources of stormwater pollution from retail gasoline outlets at their source, the Task Force BMPs will prevent and/or reduce pollution in a safer, more cost-effective and effective manner than the structural treatment controls required by the Draft Permit.

There is no evidence in the record that retail gasoline outlets present a storm water pollution problem that cannot be managed by implementation of the Task Force BMPs. The Task Force BMPs are primarily a list of source control BMPs. The Draft Permit explains that source control BMPs "aim to prevent storm water pollution by reducing the potential for contamination at the source of the pollution." Draft Permit, Part 5, p. 52. Such source control BMPs are required through SUSMPs and WSPA does not object to making retail gasoline outlets subject to appropriate source control BMPs such as those identified in the Task Force BMPs.

WSPA notes that on June 30, 1999, the Regional Board required that discharge of storm water runoff in retail gasoline outlet developments be managed in accordance with the Task Force BMPs by specific reference in Part 4.D.12. of the Municipal Storm Water Permit for the City of Long Beach. (Order No. 99-060, NPDES No. CAS004003, p. 18). The Long Beach permit did not include the numeric design standard contained in the Draft Permit. In adopting the Long Beach permit, the Regional Board found that the permit was acceptable and "when fully implemented, is expected to be consistent with the statutory standard of Maximum Extent Practicable (MEP)." Id. at 2, ¶ 7. WSPA does not understand what benefit additional structural treatment devices would provide over and above the benefits of implementing the Task Force BMPs. WSPA is not aware of any evidence in the record to show that retail gasoline outlets present a storm water pollution problem that cannot be managed by implementation of the Task Force BMPs.[1]

[1] Although WSPA intends to submit detailed comments concerning the June 2001 Technical Report at a later date, WSPA notes that the Technical Report completely fails to recognize, address or discuss the Task Force BMPs. The glaring omission of any discussion or analysis of the Task Force BMPs in the Technical Report shows that the Regional Board has not adequately considered all of the relevant guidance in California on this subject.

WSPA urges the Regional Board to exclude retail gasoline outlets from the application of the numerical design criteria and instead mandate the implementation of the best management practices described in the Task Force BMPs for retail gasoline outlets.

2. **There Is No Justification For Requiring RGOs To Build Structural Treatment Devices.**

Subsection Part 4.C.5.e of the Draft Permit would require retail gasoline outlets to build structural treatment devices. This requirement is not justified. According to the State Board's Order WQ 2000-11 (the "Order") any future mandate of numeric design standards for structural treatment at retail gasoline outlets must be supported by "proper justification." By failing to provide adequate justification for making RGOs subject to design standards, the Los Angeles Draft Permit violates the precedent of the Order.

In the Order, the State Board concluded that any future attempt to subject retail gasoline outlets to numeric design standards must be supported with proper justification. Order WQ 2000-11, p. 23. The Order stated:

> We conclude that because RGOs are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment, they should not be subject to the BMP design standards at this time, and recommend that the Regional Water Board undertake further consideration of a threshold relative to the size of the RGO, number of fueling nozzles, or some other relevant factor. This Order should not be construed to preclude inclusion of RGOs in the SUSMP design standards, with proper justification, when the permit is reissued.

Id (emphasis added).

The implementation of the Task Force BMPs would render structural treatment devices and numeric sizing criteria superfluous and lacking in benefit. No evidence has been presented, let alone "proper justification," to show that the Task Force BMPs are inadequate to prevent water quality impacts from stormwater runoff from retail gasoline outlets.[2]

3. **The Draft Permit Requirements Applicable to Retail Gasoline Outlets Exceed the "Maximum Extent Practicable" Standard of the Clean Water Act.**

The Clean Water Act only requires that storm water control measures be implemented to the "maximum extent practicable." 33 U.S.C. § 1342(p)(3)(B). As the record shows, the Task Force BMPs meet this standard for retail gasoline outlets. The Draft Permit structural treatment requirements and use of numeric design criteria, however, are neither effective nor practical for retail gasoline outlets.

[2] To the extent that the Regional Board intends to rely upon the Technical Report as an after-the-fact justification for applying structural treatment controls, WSPA believes the Technical Report is inadequate and will address the many defects of the Technical Report in detail in WSPA's subsequent comments on the Technical Report.

Retail gasoline outlets should not be required to apply the Draft Permit's "belt and suspenders" approach in light of the unique practical problems of implementing structural treatment controls at retail gasoline outlets.

First, infiltration is not an appropriate method of treatment for a retail gasoline outlet. Infiltration provides a direct pathway for liquid runoff to soak into the soil and could lead to groundwater contamination from accidental spills of gasoline since infiltration mechanisms do not distinguish between gasoline and stormwater runoff. Accidental spillage is caused by events which are beyond the control of the station owner/operator (e.g. motorist carelessness during refueling, the motorist driving off with the hose/nozzle still in the fuel tank fill neck, and accidental spillage during gasoline deliveries). Such events are recognized and incorporated into the Task Force BMPs.

The problems with infiltration at an RGO were recently recognized by the San Diego Regional Board in their adoption of San Diego's NPDES permit. In the Response to Comments prepared by the San Diego Regional Board in the proceeding, the San Diego Regional Board stated: "SDRWQCB staff agree that infiltration BMPs should not be employed at RGOs." Response to Comments, p. 189.

There is insufficient evidence in the record to show that catch-basin inserts and oil/water separators are effective for controlling stormwater pollutants at retail gasoline outlets. In fact, a recent study shows that the effectiveness of such devices has not been proven. See "Investigation of Structural Control Measures for New Development" by Larry Walker Associates, Inc. (November 1999); Task Force BMP Guide, p. 5.

The Rouge River study cited by the Regional Board does not impugn this conclusion since it did not evaluate the impact on water quality, test how the pollutant concentrations in stormwater runoff changed as a result of the use of filters or examine how implementing source control practices might have achieved better results. According to a principal author of the Rouge River study, the facilities chosen for the study did not use source control measures (i.e. BMPs) and were instructed not to do so during the study period.

Other types of treatment devices which might be used to meet the Draft Permit requirements (such as oil/water separators, sand filters, and compost filters) would require that an additional subterranean structure be built beneath the retail gasoline outlet. Such enclosed spaces can allow gasoline and gasoline vapors to mix with air, resulting in a potentially hazardous situation and result in public safety concerns.

Based on the record, there is no evidence to justify requiring retail gasoline outlets to build structural treatment controls and to meet numeric design standards as required by the Draft Permit. By imposing additional controls on retail gasoline stations beyond those that are practicable, the Regional Board exceeds its authority under the Clean Water Act.

4. **The Draft Permit Fails to Incorporate Certain Task Force BMP Provisions Required By The State Board's Order WQ 2000-11.**

In its Order WQ 2000-11, the State Board required the implementation of specific source control best management practices (BMPs) for RGOs such as those recommended in the Task Force BMPs. Order WQ 2000-11, p. 23 n.50. The Order stated:

> The mandatory BMPs that are included in the SUSMPs may be adequate to achieve MEP at RGOs, but the Regional Water Board should add additional mandatory BMPs, such as use of dry cleanup methods (e.g. sweeping) for removal of litter and debris, use of rags and absorbents for leaks and spills, restricting the practice of washing down hard surfaces unless the wash water is collected and disposed of properly, annual training of employees on proper spill cleanup and waste disposal methods, and the inclusion of BMPs to address trash receptacle areas and air/water supply areas.

Id. at pp. 22-23.

While Part 4.C.3.b.5. of the Draft Permit requires the implementation of a model SUSMP which would affect retail gasoline outlets, the Draft Permit fails to implement the specific source control best management practices required by the State Board. The Draft Permit should reference the Task Force BMPs to ensure that the specific source control BMPs discussed by the State Board in its Order are included in the SUSMPs for RGOs.

5. **The Threshold For Application Of the Numeric Standards to RGOs Is Overly Broad.**

To the extent that the Regional Board persists in attempting to mandate structural treatment controls for RGOs, the Regional Board must make a closer examination of an appropriate threshold for such regulation. The Draft Permit suggests the following criteria: "projected gasoline output of 25,000 gallons per month or more; or with four or more fueling dispensers, or with 24 or more dispensing meters or projected average daily traffic of 100 cars or more or 5,000 square feet or more of surface area" Draft Permit, p. 32. Use of these criteria in the alternative would cover virtually every RGO in Los Angeles county which will be constructed or remodeled.

These proposed criteria in the Draft Permit conflict with the recent Technical Report, which suggest application of the following two thresholds in conjunction: "(i) creates 5,000 square feet or more of impervious surface; and (ii) has a projected trip generation of 100 or more motor vehicles ADT." Technical Report, p. 9. The Regional Board appears to take these criteria from regulations in Washington and Oregon without any further analysis or justification. To the extent that the Regional Board intends to apply a threshold to RGOs, such a threshold must be chosen based on independent justification and analysis, rather than simply parroting language used in a different regulation of another state.

While WSPA will address the proposed threshold levels in more detail in its later comments concerning the Technical Report, WSPA objects to the threshold as proposed in the Draft Permit, since the threshold levels are so overbroad that they would include almost every RGO in Los

Angeles County. WSPA is unaware of any analysis of the average daily traffic at RGOs in Los Angeles undertaken by the Regional Board or any studies which show that stormwater runoff at large-volume stations requires additional treatment beyond application of the Task Force BMPs.

As discussed earlier, WSPA recommends that RGOs be excluded from application of the numeric standards entirely and instead regulated by application of the Task Force BMPs. To the extent that the Regional Board intends to apply a threshold, the Regional Board is obligated to undertake a thorough analysis of appropriate criteria and provide independent justification which has not been done here.

6. **The Regional Board Did Not Adequately Evaluate Economic Considerations.**

The Regional Board performed no meaningful analysis to determine whether any of the specified numerical design standards would be economically achievable or reasonable if applied to retail gasoline outlets. Porter-Cologne requires the Regional Board to evaluate "economic considerations" when establishing waste discharge requirements and water quality standards. Porter-Cologne, Water Code Sections 13241(d) and 13263(a). Substantial evidence before the Regional Board shows that such numeric standards are unnecessary, expensive and would provide little or no environmental benefit. In fact, such standards could result in an environmental detriment, public safety issues, or both. As one example, infiltration at retail gasoline outlets will likely cause subsurface contamination as accidental spillage of gasoline is directed into the soil because infiltration mechanisms do not distinguish between gasoline and stormwater runoff

Constructing structural treatment devices at RGOs will require significant design, construction and maintenance costs. In particular, to comply with the Draft Permit requirements, expensive pump stations may be required to operate underground stormwater treatment devices in some locations. Because the Regional Board has no reasonable basis to show that the numerical design standards in the Draft Permit are economically reasonable or practicable for RGOs, the Regional Board's application of such requirements to retail gasoline outlets is arbitrary, capricious and contrary to its authority.

7. **The Draft Permit Violates Section 13360 of the Water Code By Requiring RGOs to Construct Structural Treatment Devices.**

The Regional Board is prohibited from specifying the "design, location, type of construction, or particular manner" for compliance with a waste discharge requirement or other Regional Board order. Porter-Cologne, Water Code § 13360(a). For RGOs, the Draft Permit would mandate construction of structural treatment devices rather than allowing use of BMPs. By requiring implementation of specified numeric design requirements to mitigate storm water runoff at RGOs, the Draft Permit violates Section 13360 of the Water Code.

8. **The Regional Board Did Not Satisfy CEQA Requirements.**

The Regional Board's action will have a significant impact on the environment because it would require many new construction projects to implement specific post-construction controls, which, in the case of retail gasoline outlets at least, could have potentially significant adverse effects on groundwater. Since the proposed numerical design standards are not federally required and they

will significantly affect the environment, the Regional Board must follow CEQA requirements if it wishes to adopt such standards. Among other requirements, CEQA requires an environmental assessment of the reasonably foreseeable methods by which compliance will be achieved including an analysis of alternative means of compliance. See 14 C.C.R. § 15187.[3] To WSPA's knowledge, the Regional Board has not complied with such CEQA requirements in adopting the Draft Permit.

9. **The Regional Board Did Not Comply with the Administrative Procedure Act.**

The Regional Board did not follow the requirements of the California Administrative Procedure Act (APA). The APA applies because the Draft Permit requirements for retail gasoline outlets are a standard of general application which meets the APA definition of a regulation. See Government Code Section 11342. Government Code Section 11352(b) does not exempt the Draft Permit from the APA because this provision only exempts required "waste discharge requirements and permits" and, as described above, the Draft Permit requirements exceed what is required by the Clean Water Act. Therefore, the Regional Board's adoption of the numeric design standards is a quasi-legislative action and the APA applies.

10. **The Numeric Design Standards Are An Unfunded Mandate.**

The Draft Permit's numeric design standards also constitute an unfunded mandate prohibited by the California Constitution. See Cal. Constitution Art. 13B § 6. Since the Draft Permit requirements exceed what is required by federal law, such limits are not "costs mandated by the federal government." Government Code Section 17513. Consequently, since the numeric design standards do not qualify as a federal mandate, the Regional Board's order is invalid because it does not provide for appropriate funding.

In conclusion, the Draft Permit's imposition of unnecessary and potentially harmful standards on retail gasoline outlets beyond what is practicable under the Clean Water Act is improper. WSPA respectfully urges the Board to modify the Draft Permit by exempting retail gasoline outlets from the structural treatment controls and the numeric design standards, and, instead, to mandate the effective and appropriate BMPs contained in the Task Force BMP Guide. Finally, as we stated at the beginning of the letter, WSPA will be providing more detailed comments concerning the Technical Report and the Draft Permit in the near future.

Sincerely,

Ronald Wilkniss

[3] While the Regional Board may contend that the Draft Permit is exempt from CEQA by reason of Water Code Section 13389, that section only exempts the adoption of federally-mandated waste discharge requirements and permits. See Water Code § 13372; Committee for a Progressive Gilroy v. State Water Resources Control Bd., 192 Cal. App. 3d 847 (1987). As discussed above, the Clean Water Act only requires stormwater controls to the "maximum extent practicable" and the imposition of impracticable controls such as the numeric sizing criteria and structural treatment requirements for retail gasoline outlets are not federally required. Since the Draft Permit requirements imposed on retail gasoline outlets are not federally-mandated and could cause environmental degradation, CEQA review is required.

Ballona Creek /Santa Monica Bay Watershed

May 15, 2001

Mr. Dennis Dickerson, Executive Officer
Los Angeles Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, California 90013-1105

2001 MAY 18 P 2:09

Dear Mr. Dickerson,

As per your request, the following are comments regarding the first draft of the upcoming NPDES Permit for the municipalities in LA County. These comments have been discussed at the watershed meeting by the member cities (listed below) and are herby submitted to you on their behalf. Your serious consideration in incorporating these comments is highly appreciated. Please call me at 562-802-7880 extension 29 if you have any questions.

Sincerely,

Sheila Kennedy
Chair

Specific comments are:

FINDINGS

***Item 10*: Storm Water Management Plan is acceptable**

This item states that the proposed Storm Water Management Plan submitted by the County was acceptable. If this is the case, then there appears to be no reason for the changes in structure and requirements in the proposed permit.

The Model Programs (or SWMP, or SQMP) in the previous permit

were generally in continuous development, up until the approval of the SUSMP program in late 2000. Why are they now being changed again?

Item 39: Enforcement Authority

The draft permit requires the permittees to perform some enforcement actions for the State Permit, but specifically states in this finding that the enforcement authority for NPDES permits belongs to the Regional Board.

Typographical Error - This section should read "...in the Los Angeles Region for the two statewide..."

Part 1 – Discharge Prohibitions

Section 2

The procedure for permittees to petition for exemption of a discharge has been removed with no explanation, and the authority for adding or removing items from the list given to only the Executive Officer.

Part 2 – Receiving Water Limitations

Section 2.3.a

The procedure does not make sense. The Permittees are not responsible for water quality monitoring, so how will they know when they are exceeding water quality standards?

Section 2.A

This section exempts the County (the Principal Permittee) from ensuring the compliance of any of the co-permittees, but does not do the reverse (exempt the co-permittees from ensuring the compliance of the County).

Section 2.A.1

This section states that the Principal Permittee will negotiate NPDES requirements with the Board. The permit should not be written to give the impression that the Co-permittees are giving up their right to negotiate the permit with the board directly, if the EAC or County hold a contrary position.

Section B.2 and B.6

The coordination and facilitation elements of these two items are effectively duplicates. They should be combined, or one removed.

Part 3 – SQMP Implementation, Monitoring and Reporting

Section 3.C

This section requires the WMC to do several things, with no real guidelines (i.e. prioritize pollution control efforts, develop-update-monitor adequate implementation, etc.). It seems as if the Board

wants to set up the WMC as a middle oversight body rather than as an information exchange body.

Another difficulty is that several "prioritization" items are assigned to the WMC, but there is no requirement that an individual permittee comply with anything from the WMC. Either the WMC should be given enforcement authority over the permittees, or the "prioritization" should be left up to the individual permittees, since they are ultimately responsible, not the WMC.

Section 3.D

There are no requirements for any actions by the EAC, although there are actions referred to in other sections. These responsibilities should be consolidated here.

Section 3.E.1

This appears to in essence be a duplicate of Part 3, B.5. It also implies that there would be elements of the SQMP that are NOT consistent with the terms of this permit. This should be reworded or removed as unnecessary.

Section 3.F

There should be a consistent method referenced for modification of the SQMP. In various areas this is noted as both the responsibility of the permittees and the principal permittee. As the SQMP is a "county wide" document and part of the permit itself, isn't it true that any change should involve all the permittees? If the change is only to an individual permittees program, then the permit should state that, and not use the SQMP terminology.

Section 3.G

This section covers the legal authority of the Permittees. Is this area intended for the permittees to constantly be revising their ordinances? Is there a way to write a general ordinance, and just change the implementation policy every time the SQMP is changed?

Section 3.G.1.m and 3.G.1.n

This requires that the City control discharges from sites under the GIASP and GCSP. This seems to result in either a) a duplicate enforcement process, or b) the City being the enforcing body for the State requirements. Neither is acceptable, since in the first case this is basically unnecessary duplication, and in the second not the City's responsibility to enforce the state permit.

Section 3.G.1.p

The permit requires an ordinance "effective immediately upon the adoption of this Order." Is it even legally possible to write an ordinance adopting permit requirements that have not yet been

finalized?

Section 3.H

This section requires copies of "...any proposed changes to the SQMP and its components...". Per Part 3 Section F, changes to the SQMP must be either approved by the Board or done at the request of the Board. Why include additional copies of something they already have?

Section 3.I

The budget reporting system should be revised based on the difficulties encountered so far. There should be a consistent way of determining which budget line items to report, and the submittal date should be based on the City's fiscal year.

Section 3.K

This item should be included in Part 3 Section F.3

Part 4 – Special Provisions

Part 4.A – Public Information

Section A.1.c

The permit does not state who will be responsible for the new signage, the city that the "designated access point" is in, or the owner of the channel?

Part 4.B – Industrial Commercial Inspections

Section 4.B

As this program has been changed in focus from education to inspection and enforcement, it should be moved to the ICID program for ease of reference.

Part 4.B – Industrial Commercial Inspections

Section 4.B.1

This sentence is unclear. Permittee shall require use of what by businesses. It appears to mean require use of the program itself, but that is not possible.

Part 4.B – Industrial Commercial Inspections

Section 4.B.2

On it's face, this requirement appears to include every industrial or commercial business in the City. This is contradictory to the existing permit, which required visits based on the type of business and the potential for exposure. Under the older program, there was always the opportunity and requirement to add businesses that were found to be potential polluters.

Part 4.B – Industrial Commercial Inspections

Section 4.B.3.c

This item should be clarified to indicate who is required to do the inspections. Is this intended for the County Health Department to take over storm water inspections at restaurants? If so, who is considered responsible if exceedances occur?

Part 4.B – Industrial Commercial Inspections

This table can be significantly simplified by just stating that any business shall be inspected every 24 months, not less than twice

Section 4.B.5.b

during the permit (since all inspection requirements are identical).

Part 4.B – Industrial Commercial Inspections

Section 4.B.5.d

How is the permittee to determine if the board has made an inspection or not? This is indeed an irrelevant section, since even if the Board HAS inspected the site, that will not eliminate the potential liability if something were to occur and the City had NOT inspected it, therefore it would be in the Cities best interest to inspect it anyway.

Part 4.B – Industrial Commercial Inspections

Section 4.B.6.a

Please specify what sanctions would satisfy this requirement (financial, criminal, etc.).

Part 4.B – Industrial Commercial Inspections

Section 4.B.7.a

This notification requirement is burdensome and confusing. If there is a violation of a City ordinance, the City is the enforcing agency. Such a broad definition of "non-compliance" would result in a very large number of "violations" being referred to the board, which would normally be handled by the City in an educational manner (educational materials, follow up letter, one or two informal follow up inspections). These are normally single incidents, either accidental or by someone who hadn't been adequately educated at the time, and are typically not repeated once the situation is explained to them. What the Board would do with this information is unclear, since a violation of a City ordinance may not be a violation of a Board order that they could enforce, and such incidents are reported in the Annual Report.

Additionally, if there is a violation of a State requirement, the State is the enforcing agency (see Item 39) and has not delegated that responsibility formally to the Cities. Although the City may be able to review information that a business submits to the State (an SWPPP for example) to ensure that it also meets City standards, the City does not have the authority to determine whether or not a given SWPPP is in compliance with State requirements. The City cannot perform the State's job function in this manner.

And, as was discussed at length during the previous permit, the Cities do not have the authority to require a given business to obtain a State permit, since it is solely the States responsibility to determine whether or not an NPDES permit is necessary for a given site. A City can require that a business provide proof that they are complying with state requirements (such as an NOI), but do they now keep duplicate records listing all the businesses that have been determined NOT to require a permit? (i.e. Category 11

	dischargers with no exposure)
Part 4.C – Development Planning ***Section 4.C.3.c***	SUSMPs have been developed for each of the other types of projects (listed in section C.3.b), but no equivalent standard for projects in Environmentally Sensitive Areas (ESA) has been developed. Since projects in these areas could take any number of forms, it is unlikely that a "standard" plan could be effectively developed. Also, as of this draft of the permit, a list of these "ESA"s has not been provided for review.
Part 4.C – Development Planning ***Section 4.C.9***	It is unclear what authority the City has to regulate property transfers between two private parties. Is the City now to keep track of each property transfer and maintain records on who is responsible for maintenance of a site?
Part 4.C – Development Planning ***Section 4.C.10***	This section is completely unclear as to its intent and specifics.
Part 4.C – Development Planning ***Section 4.C.12***	Most cities are on a set schedule to update general plans (5 years or so), as such the 540 day deadline should be changed to the next scheduled general plan revision.
Part 4.C – Development Planning ***Section 4.C.14***	This should be assigned to the Principal Permittee, since it is intended to be a countywide consistent document.
Part 4.D – Development Construction ***Section 4.D.1.a***	This should be clarified further. Is it intended that City personnel attend all such meetings or workshops, or merely to provide information for voluntary distribution during such meetings?
Part 4.D – Development Construction ***Section 4.D.1.c***	Several of the items listed in the "minimum BMPs" are not actually BMPs. If a minimum list is envisioned, it should be spelled out here.
Part 4.D – Development Construction ***Section 4.D.2***	The statement that a Local SWPPP can replace a State SWPPP should be removed, as it is not relevant to the Local SWPPP requirements.
Part 4.D – Development Construction ***Section 4.D.3***	Permittee inspectors additional actions must be limited to local ordinances and codes, since they do not have the authority to enforce state laws in this case.

	The phrase "...if non-compliance continues..." is vague, a set method and rational for referring sites to the Board should be determined to avoid confusion.
Part 4.D – Development Construction ***Section 4.D.4.b***	Without additional rationale, the requirement of an "electronic system" is not justified. Smaller cities may not have a number of grading permits that would justify the expense of installing a new tracking system. Does the Board intend to eventually require electronic submittal of all grading permits? If so, a standardized format should be developed now for ease of future integration.
Part 4.E – Public Agency Activities ***Section 4.E.1***	Details for the sections on Parking Facilities Management, Public Industrial Activities, and Dry Weather Diversions have been omitted from this draft.
Part 4.E – Public Agency Activities ***Section 4.E.2***	Does the Board intend for the CMOM provisions to take the place of the Sewer section of the Public Agency program? If so, this should be specified.
Part 4.E – Public Agency Activities ***Section 4.E.4.f***	A blanket requirement to reduce use, storage and handling is not useful, some guidelines (i.e. reduction from what amounts?) must be provided.
Part 4.E – Public Agency Activities ***Section 4.E.5***	There is a numbering inconsistency in this section, and duplication of at least one item.
Part 4.E – Public Agency Activities ***Section 4.E.6.a***	No definition of "high" and "moderate" volumes of trash was provided. In addition, the TMDL also does not contain definitions of "high" and "moderate" volumes of trash. Section IV.A of the L.A. River Trash TMDL states that if the Cities rely on the Default Baseline Waste Load Allocation, *"The final Default Baseline Waste Load Allocation, as described in compressed volume and/or dry weight, will be specified in the stormwater permit."* This definition also appears to have been omitted.
Part 4.E – Public Agency Activities ***Section 4.E.7***	A section should be inserted stating that the Permittees shall not be held responsible under the permit for discharges in excess of numerical limits that occur as a result of such emergency situations. For instance, a sewer break and overflow resulting from an earthquake would likely exceed bacteria discharge limits. If BMPs (such as containment) are delayed because of the emergency,

	the Permittees should not be held liable for the discharge that occurred between the earthquake and the implementation of the BMP.
Part 4.F – ICID Program *Section 4.F.1.a*	The permittee should be given the option to adopt the ICID section of the SQMP as written, to avoid the additional paperwork of creating an unnecessary document.
Part 4.F – ICID Program *Section 4.F.1.b*	The tracking system should be developed by the Principal Permittee, since the goal is to have a consistent and countywide system controlled by the Principal Permittee.
Part 4.F – ICID Program *Section 4.F.2.b*	What is the rational for specifying that the Permittees specifically consider the 1994 Northridge quake and the "civil unrest"?

Subject: First Draft - LA County Municipal Storm Water NPDES Permit.

Xavier, please see my comments below.

Distribution List - Consultants, NEST Environmental Services: currently blank! add Don Reh as contact.

Fact Sheet/Staff Report:

Part II

Recommend putting in an LA County map that shows by rectangles and labels the six six watersheds mentioned in Part II

Part III

Isn't there a Phase that covers currently unpermitted industries and activities such as auto body shops and mall/strip parking lots? Shouldn't that be included, since they, esp. parking lots contribute so much to the polluted runoff?

Part V

Finally, someone acknowledging from group monitoring data that heavy metals, copper and zinc, are major polluting issues in storm water runoff.

Part VI

A. Add (PIPP) after Public Information and Part... Program to clarify the acronym PIPP in Background p.8

Justification: p.11 Spell out SQMP and TMDL. Maybe everyone doesn't know those acronyms.

2. Programs for Business, p.11. Isn't it time to add auto body and repair shops and shopping mall/strip parking lots as part of the target?

B. Industrial/Commercial Inspection Program, p. 14. 2nd set of bullets, Inspect and monitor industrial facilities.. add "to ensure" that ...

p.16 under the bullet "For all". Not clear to me what the phrase "Automotive services" includes: I think it should specifically identify what it includes: gas stations, auto body repairs, vehicle dismanters etc., or maybe reference the Part 5 Definiitions of the Draft Permit.

E. Public Agency Activities. p.23, 2nd bullet: Permittee-owned parking lots shall be... Why can't you spell out this same level of performance for shopping map/strip and emloyee parking lots elsewhere in this permit?
same page 5th bullet. "designated areas" is too vague. NEST deals with 16 ready mix concrete manufacturers and they use impervious rather than "designated" washout areas in which the water either evaporates or gets recycled back into process water. I think this "impervious" standard should be the same for public agency concrete businesses.

F. New development and Significant Redevelopment, last para. p.24., 8th line, should be ("vehicle" vs the existing "auto" salvage yards.

p.27, 3rd line down. New sentence starts: The State of Maryland - then text ends. Something missing?
p. 27, 1st para, it is not clear to me what the difference between highest pollution concentration and pollutant load. The terminology pollution concentration in terms of mg/L I understand; is pollutant load something else?

A. Mass Emissions Monitoring. • New Requirement. Acronyms MDL and CTR. Spell out which MDL - the maximum daily load or the method detection limit? Spell out CTR for thoise not familiar with it.

p32. talks about TSS sampling. Are Group.Phase I storm water sampling parameters going to change to reflect SSC analytic methods for the season 2001-2002?

Page 3
DRAFT LA RWQCB Order

Refers to Appendix A in various places. Appendix A not labeled or found.

Part 4 Special Provisions,

A. Public Information and Participation Program. Add (PIPP) after header.

B. Programs for Industrial/Commercial Inspections. Which Agency, the MS4 or the RWB has the last say in conflicts over whether an industrial site is implementing adequate BMPs. For example if the RWB Inspector inspects and facility and accepts the site implemented BMPs and later, the MS4 Inspector inspects and says that a certain additional BMPs area required. Or a RWB inspector comes after a MS4 Inspector and says that a particlular BMP is not necessary. Who has the final say? Do industrial facility operators have the right to appeal a MS4 determination of non-compliance with the RWB?

Part 6

E. Inspection and Entry. Should this also specifically include Permittee authorized representatives since they are not part of the Regional Board or USEPA?

Attachment 2

Malibu Creek Lakes and Tributaries. Is there a consent decree date associated with this TMDL?

Will the Phase I industrial permittees also have to send copies of their monitoring results (visual and Storm water sample) and Annual Report to the Permittee (city) in which their business operates?

Chief Engineer and General Manager

May 15, 2001
File No.: 31-370.10

2001 MAY 17 P 2:42

Mr. Dennis Dickerson, Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, Ca 90013

Dear Mr. Dickerson:

Draft Order No. 01-XXX (NPDES No. CAS614001)
Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles and the Incorporated Cities, except for the Cities of Long Beach and Santa Clarita

The County Sanitation Districts of Los Angeles County (Districts) have reviewed the April 13, 2001 *Draft Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges Within the County of Los Angeles and the Incorporated Cities, Except for the Cities of Long Beach and Santa Clarita* (Draft Permit). After reviewing the proposed waste discharge requirements, we have several comments/concerns which are discussed in detail below.

Numerical Design Criteria for Post-Construction Treatment Control BMP's

The Regional Board proposes to add new numerical mitigation criteria for flow-based structural and treatment control BMPs. At present, the Standard Urban Storm Water Mitigation Plan (SUSMP) already includes numerical design criteria for volumetric structural and treatment control BMPs; the proposed criteria are unjustified and may also result in detriments that should be considered. For example, the Districts are concerned that the proposed flow-based design criteria will result in more requests for diversion projects of storm weather flow to treatment plants rather than the implementation of practical structural and treatment control BMPs. Also, the high cost of real estate and shortage of available open space land in Los Angeles County does not provide incentive for installing post-construction treatment control BMPs that require large areas. As such, the Districts do not feel that this is the result that the Regional Board intended with the proposed criteria.

Dry Weather Diversions

The Draft Permit requires each Permittee to implement a Public Agency program to minimize storm water pollution impacts from public agency activities. The proposed program includes, among other

components, dry weather diversions. The Districts support the implementation of programs to minimize storm water pollution impacts and dry weather diversion projects for appropriate specific cases; however, the Draft Permit does not provide guidance with regard to selection of storm drains for diversion projects. For example, if a receiving water is determined to violate state bacteria standards during wet weather events; the Regional Board should review its designated use(s) to make sure that the standards were correctly set. The problem often arises because standards are primarily based on dry weather data designed to allow primary contact recreation to occur; these standards should not apply during wet weather when contact recreation does not take place. If people in a particular community do not use a receiving water to swim in during storm events, a refined use (one that excludes primary contact recreation) or refined water quality objectives (i.e., perhaps seasonal) should be established. This will avoid unnecessary actions such as an impaired waters listing, the development of a TMDL for bacteria, storm water control requirements, and the need for diversion. Furthermore, the Draft Permit should also include proper guidance with respect to dry weather diversion projects to minimize the risks of excessive accidental storm flows and/or spills of pollutants reaching POTWs and causing pass-through of pollutants to receiving waters.

Location of Monitoring Stations

The Districts agree with the Regional Board that a comprehensive monitoring program can supply a wealth of data that can be used in a wide range of applications for improving water quality. However, we also believe that the storm water monitoring program should avoid duplicative or unproductive monitoring and should ensure that the data collected are useful. Specifically, we are concerned about the location of monitoring stations close to the Districts' treatment plants. Because the Districts' NPDES permits for the treatment plants include requirements for monitoring of receiving waters, the Districts possess a large database containing water quality data on receiving water stations close to the Districts' plants. Coordinating the placement of monitoring sites (using a regional watershed approach) between all direct dischargers and the municipalities will reduce monitoring costs and result in saving existing resources. The Draft Permit provides no guidance or detail on how this coordination will happen.

Mass Emission Monitoring

The Draft Permit requires that a sample be obtained during the first storm event and analyzed for all constituents listed in Attachment 1, which includes more than 230 parameters. Even though the Draft Permit allows for reduction of parameters to be analyzed, the entire list is required for the first storm of each season. The Districts believe that this requirement is excessive, in that if a constituents has not been detected in a receiving water over consecutive periods, there is no reason to continue analyzing for that parameter. The resources would be better used for other purposes. In addition, the Districts suggest that the Regional Board address safety concerns for receiving water sampling during storm events. It makes sense to obtain a receiving water sample only when it is safe to do so.

Use of Collected Data

The Districts request that the Regional Board be more specific and include details in the Permit on how monitoring data will be used in assessing the effectiveness of an urban runoff management program. The Districts believe that some of the monitoring requirements are excessive, such as river toxicity studies. The primary goal of collecting monitoring data should be to determine the performance or effectiveness of the BMPs. The Districts are concerned that the Draft Permit fails to include appropriate "safe harbor" language particularly for alleged exceedences of water quality objectives. Thus, even if appropriate BMPs were implemented to control pollutants "to the maximum extent practicable," cities may still be subject to enforcement actions and/or fines.

The Districts appreciate the opportunity to comment on the Draft Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles and the Incorporated Cities, except the Cities of Long Beach and Santa Clarita. If you have any questions or concerns regarding the information, please contact June Nguyen at (562) 699-7411, extension 2830.

Very truly yours,

James F. Stahl

Re: Joint Request For Los Angeles Storm Water Permit Facilitated Negotiation Process

Dear Mr. Dickerson:

The Independent Cities Association (ICA), which is comprised of fifty-one cities in the Southern California area, supports a consensus building process to address concerns regarding the proposed Los Angeles Municipal Storm Water NPDES Permit (Permit). The process proposed in the attached letter from The Coalition For Practical Regulation is generally supported by ICA.

The Independent Cities Association stands ready to assist you in formulating an NPDES Permit that makes sense for Los Angeles County.

Thank you for considering the position of the Independent Cities Association.

Sincerely,

Mary Cammarano

JOINT REQUEST FOR LOS ANGELES STORM WATER PERMIT FACILITATED NEGOTIATION PROCESS

Dear Mr. Dickerson:

This letter is to request that you join the undersigned in supporting a facilitated negotiation process to help you, your staff, the public and your Board solicit and expeditiously address concerns from various stakeholders regarding the proposed Los Angeles Municipal Storm Water NPDES Permit (Permit). The process proposed herein is designed to encourage consensus and resolution of issues involving the proposed Permit, through a forum that allows for the thoughtful exchange of concerns, ideas and issues, on a real time basis, thereby reducing the development time for a final Permit and resulting in a Permit that has broad support at all levels. This process could and probably should employ a facilitator to bring regulatory, municipal, business and environmental stakeholders together with the common goal of determining the most practical and effective measures to include in the Permit to improve our water quality.

Since it is all of our desires to address water quality concerns in a timely manner, we believe this process should begin no later than July and be completed in 60 days, and that it will result in an NPDES Permit that will avoid continuing legal debates and disputes. This time period is consistent with the time period you and your Board are proposing for Permit adoption, and in the long run hopefully avoid ongoing challenges to the Permit terms, as it will decrease the likelihood of administrative appeals and lawsuits and increase the effectiveness of the policies adopted.

The facilitator for this process should be selected based on input from the various stakeholders and would not require any funding from the Regional Water Quality Control Board. It should be understood that this process would at best result in a draft permit, to be subject to further review by the general public, and by the Regional Board itself for its ultimate approval. Moreover, the information developed in the process should prove to be invaluable in compiling a consensus approach to clean water, and should spill over into agreement on other issues such as the TMDL process itself.

Please join us in bringing stakeholders together during the development process of the Permit, rather than waiting until adoption before your Board and help us help you formulate an NPDES Permit that makes sense for Los Angeles County.

Organizations which have been identified for participation include:

The Building Industry Association, The California Restaurant Association, The City of Los Angeles, The Coalition for Practical Regulation, The County of Los Angeles, The Economic Development Council, The Executive Advisor Committee, Heal the Bay, The NRDC, The Santa Monica Baykeeper, The Storm Water Quality Task Force, and The Western States Petroleum Association.

Dear Mr. Dickerson:

WITHDRAWAL OF THE REPORT OF WASTE DISCHARGE FOR SANTA CLARA RIVER WATERSHED

As discussed between Mustafa Ariki and Xavier Swamikannu, the purpose of this letter is to rescind the Santa Clara River Watershed's Report of Waste Discharge (ROWD) application, submitted to your office on January 31, 2001, and to add the Watershed as part of the Los Angeles Basin' ROWD application. In our comments to your Los Angeles Basin's National Pollutant Discharge Elimination System First Draft Permit, submitted to you on May 16, 2001, we included the necessary changes for the addition of the Santa Clara Watershed to the Los Angeles Basin's ROWD application.

If you have any questions, please contact Mr. Mustafa Ariki at (626) 458-5948, Monday through Thursday, 7:30 a.m. to 6 p.m.

LOS ANGELES COUNTY MUNICIPAL NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) STORM WATER PERMIT RENEWAL – NPDES PERMIT No. CAS614001, CI 6948

Dear Mr. Fike:

Thank you for your letter dated April 18, 2001 expressing your to your concerns with the workshop of April 24, 2001 and the public review schedule established for the Los Angeles County Municipal Storm Water NPDES permit. I appreciate that you took the time to relay your concerns and I value your perspective.

The primary purpose of the public workshop held April 24, 2001 (eleven days following release of the draft permit) was for Regional Board staff to explain the proposed changes in the draft permit to facilitate subsequent public review and comment. The intent, in this case, was to begin the review and comment process. Our sense was that this could be best initiated by holding a workshop to allow Regional Board staff to explain the basis on which elements of the draft permit were developed. By so doing, interested parties preparing comments would have the benefit of this perspective to assist them in developing their comments on the draft permit. Secondarily, the workshop was an opportunity for interested parties to offer preliminary comments on the draft, if they were prepared to do so, and as appropriate, exchange information during the public forum. In this sense, the workshop was very well attended and successful. I should note that during the public forum, Mr. Luis Salaya of the City of Monrovia did provide comments to our staff.

Public comments on the draft were due May 16, 2001. This gave interested parties over 30 days to comment on the first draft alone. Regional Board staff are carefully reviewing the comments and will make changes as necessary to the draft. We also plan to send out a response to comments with the second draft of the permit (tentative permit). At that time, interested parties will have an additional month to provide written comments on the tentative permit.

Please note that the Regional Board will conduct a workshop where our Board members will ask questions of staff and the public and hear comments from the public on the second draft of the permit. This workshop is scheduled to take place on July 26, 2001. We will advise all interested parties regarding the final location and time for the workshop.

Once again, thank you very much for your letter. If you have any questions please feel free to call me directly at (213) 576-6605 or, please have your staff call Carlos Urrunaga at (213) 576-6655.

Sincerely,

Dennis A. Dickerson

Subject: Monitoring Changes

TJ,

Attached is a summary of the changes to the monitoring program that we discussed earlier today. If you send me your fax number, I will send over the Workplan for Wet Weather Modeling that I referred to. If you are not familiar with the Source ID Monitoring section, ask Bill, I think you all are already participating.

We would still like you to present the analysis of land use data at next Wednesday's meeting.

I will be sending a preliminary second draft soon (hopefully tomorrow). If not, the main points of discussion for the meeting are on the attached outline.

Let me know if you have any questions.

Megan

CC: bdepoto@dpw.co.la.ca.us; ctrevizo@dpw.co.la.ca.us; Dan Radulescu; ghowe@dpw.co.la.ca.us; mariki@dpw.co.la.ca.us; Megan Fisher; Xavier Swamikannu

Outline of Significant Changes to Monitoring Program (5-22-01)

Mass Emissions:
Purpose: The purpose of mass emission monitoring is to estimate the mass emissions from the MS4, detect trends, and compare data to existing standards.

- First storm of each year shall be monitored for SIP minimum levels, if a constituent is not detected, the current MDLs may be used for the rest of the year. If SIP levels are detected, the lower MDLs (listed in Attachment 2 of draft) shall continue to be used. This change is for cost-saving purposes.
- Due to the high variability of storm water, sampling all large storms would be the most accurate way to determine an average mass emission load. However, since this is cost-prohibitive, TSS data can be used as a load indicator (most constituents correlate with TSS). Therefore, the Principal Permittee shall analyze all additional storms greater than .25 inch (in addition to the original requirement) for TSS.

Estuary Monitoring:
Purpose: Sample estuaries to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. Produce a map of each estuary depicting the areas of degraded sediment.

- Sample 25 sites in each estuary once during the permit cycle. One estuary can be sampled each year, or they can be done concurrently.
- Analyze samples for sediment toxicity, chemistry and benthic community
- The resulting map and data will help determine appropriate locations for monitoring trends in sediment deposition and composition associated with storm water (possibly in next permit)
- Stations outside of direct outfalls should also be monitored to assess cumulative effects
- This effort should be undertaken in parallel to the Regional Monitoring (Bight-wide 03), so it can be compared to other areas of Southern California to determine regional patterns of distribution and fate of pollutants in storm water

Source ID Monitoring:
Purpose: This requirement has been changed to support an on-going effort by the County, the Regional Board, SCCWRP, etc... to develop a dynamic wet weather runoff model. As an immediate purpose, the data collected will help determine what proportion of the cumulative runoff load of various constituents is generated from specific land uses (critical sources), sub-watersheds, or municipal entities. The ultimate goal is to develop a model that can be regionally applied to target locations or sources that contribute pollutants, prioritize locations that need management actions, and assign load and waste load allocations for TMDLs. Overall, this Source ID monitoring will more efficiently achieve the goal of locating sources and needed management actions, and it will

be more widely applicable than the tributary monitoring as it was written in the draft.

As part of the existing modeling effort, 21 specific land uses have been identified (Table 1 of the General Workplan for Wet Weather Modeling of the Los Angeles River). Water quality data collected to date consists largely of event mean concentrations, but a dynamic model needs information throughout the course of a storm. Therefore, time-concentration series should be obtained for the specific land uses. Due to storm variability, time concentration information should be collected during multiple storm events.

- Monitor 10 site events, this could be from 10 different critical sources, or 2 events from 5 critical sources (effort of participation consistent with that of the Regional Board)
- Each site event includes 10 time-paced samples, to cover the entire range of the storm. For example, samples should be taken every hour for a 10 hour storm.
- Each site sample should be analyzed for constituents that exceed standards at the respective mass emission station, TSS, bacteria, nutrients, trace metals, organophosphorus pesticides, and PAHs
- Sampling and site selection should be consistent with the existing effort
- County may reconfigure existing land use and/or critical source stations, if appropriate

Bioassessment

Considering the status of bioassessment development in Southern California, it may be more appropriate to focus this requirement on the need to develop a bioassessment tool and Index of Biological Integrity (IBI) for this region. Instead of the monitoring in the first draft, the County should focus on jointly developing reference conditions, natural variability in this region, and an IBI with the Southern California Stormwater Research/Monitoring Program, or other existing regional efforts.

SUBJECT: Joint Request For Los Angeles Storm Water Permit Facilitator

Dear Mr. Dickerson:

This letter is to request that you join the undersigned in supporting a facilitated review or consensus building process to help you, your staff, the public and your Board solicit and expeditiously address concerns from various stakeholders regarding the proposed Los Angeles Municipal Storm Water NPDES Permit (Permit). We acknowledge that your staffing and resources are stretched and divided between many priorities. The Permit process also places great demands on the Board. The goal of the facilitated review process is to assist all of the stakeholders, the staff and the Board in understanding the issues and reaching consensus on the Draft Permit.

The proposed facilitation is designed to encourage consensus and resolution of issues through a forum that allows for the thoughtful exchange of concerns, ideas and issues, all on a real time basis. The proposed process will reduce the development time for a final Permit and will result in a Permit that presumably has broad support at all levels. The facilitator will bring regulatory, municipal, business and environmental stakeholders together with the common goal of determining the most practical and effective measures to include in the Permit to improve our water quality.

Since it is all of our desires to address water quality concerns in a timely manner, we believe the facilitated review process should begin no later than July and be completed in 60 days, and that it will result in an NPDES Permit that will avoid continuing debates and disputes.

2175 Cherry Avenue ♦ Signal Hill, CA 90806 ♦ (562) 989-7302 ♦ (562) 989-7393 Fax

This time period is consistent with the time period you and your Board are proposing for Permit adoption, and we believe that the process, in the long run will hopefully avoid ongoing challenges to the Permit terms, as it will decrease the likelihood of administrative appeals and litigation, and increase the effectiveness of the policies adopted.

The facilitator should be selected based on input from the various participating stakeholders and would not require any funding from the Regional Water Quality Control Board. The Coalition and other stakeholders have volunteered to provide the financial support for the facilitator. It would then be our hope that the results of the facilitated review process would be placed into the Final Permit, which would be subject to further review by the general public, and by the Regional Board itself for its ultimate approval. Moreover, the information and methods utilized and developed in the process should prove to be invaluable in developing a similar consensus building approach in other related storm water runoff issues, such as the TMDL process.

Please join us in bringing interested stakeholders together to develop a more effective and efficient review process for the MS4 NPDES Permit for Los Angeles County. We believe that a facilitated review process will ultimately help you and the Board in formulating an NPDES Permit that makes sense for Los Angeles County.

By our forwarding a copy of this request to the following organizations, the Coalition for Practical Regulation hereby invites all of these organizations to participate in this proposed facilitated review process:

The Building Industry Association of Southern Califorina, the California Restaurant Association, the City of Los Angeles, the County of Los Angeles, the Economic Development Council, the Executive Advisor Committee, Heal the Bay, the NRDC, the Santa Monica Baykeeper, the Storm Water Quality Task Force, and the Western States Petroleum Association.

Sincerely,

Larry Forester

PO Box 47600
Olympia, WA 98504-7600

Dear Ms. Wessel:

REQUEST FOR INFORMATION ON RETAIL GASOLINE OUTLETS OR FUEL DISPENSING FACILITIES ADDRESSED BY THE MUNICIPAL STORM WATER PERMIT IN THE STATE OF WASHINGTON AND CITY OF SEATTLE

I am writing to request your assistance in providing information on the new development requirements to treat storm water runoff from retail gasoline outlets (RGOs) or fuel dispensing facilities in Western Washington State and the City of Seattle.

The California Regional Water Quality Control Board, Los Angeles Region is the responsible State Agency to issue National Pollutant Discharge Elimination System (NPDES) permits in the Los Angeles Region. We are in the process of renewing the Municipal Separate Storm Sewer System (MS4) permit for Los Angeles County and the incorporated cities.

We will greatly value your response to the following questions.

1. Why are RGOs specified as a development category that must treat storm water runoff?

2. What was the justification and basis for the categorization of RGOs as a priority category or in other way as a contributor or potential contributor of pollutants in the storm water runoff?

3. What are the pollutants of concern in untreated storm water runoff from RGOs in your opinion?

4. Is there a minimum size or area threshold for RGOs to be subject to the new development requirements for storm water controls?

5. Do you use alternative thresholds (such as traffic volume, fuel dispensing volume, number of nozzles etc) to trigger the requirement of storm water control measures at RGOs (existing or new development)?

6. What types of storm water controls or treatment BMPs do RGOs most often select to mitigate storm water pollution?

7. Do you have different treatment requirements for storm water from the vehicle fueling areas as opposed to the vehicle access areas? If so what are they?

8. What is the estimated economic cost of implementing storm water controls at RGOs relative to project cost?

9. What percent approximately of the RGO area is taken up by treatment control BMPs?

10. When (year) did RGOs first become subject to new development requirements for storm water treatment in your jurisdiction?

11. Has the implementation of treatment control BMPs at RGOs improved the quality of storm water discharges in your jurisdiction?

12. What mechanism do you use to ensure that the treatment BMPs are properly maintained?

We appreciate your time and effort in responding to our questions. Please include any additional materials (such as codes, guidelines, etc.) to supplement your response. Your response will greatly assist us in our development of requirements and justification for the control of storm water runoff from RGOs and gas stations. It would be most helpful if you send your response to reach us on or before June 15.

If you have any questions, please do no hesitate to contact me at (213) 576-6668. Thank you very much for your assistance in this matter.

SUBJECT: BIOASSESSMENT IN THE LA COUNTY STORM WATER PERMIT

Unfortunately, I will not be able to attend the meeting scheduled for May 30, 2001, to discuss the monitoring requirements of the LA County Stormwater Permit because I will be attending a conference on bioassessment in Tahoe. Therefore, I am providing this as the basis for the critical incorporation of a bioassessment monitoring program in the County's permit.

Legal Requirement of the Clean Water Act

First, biological monitoring is required under the Clean Water Act, which states the primary goal is to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters." This mandate cannot be carried out without some measure of the biological integrity of the State's/Nation's waters. One of the ways in which the Regional Boards control water quality and protect beneficial uses is through the NPDES permit. In this permit, the Regional Board requires the discharger to monitor the receiving waters of the discharge using various methods that will prove that the discharge is not degrading the chemical, physical, and biological integrity of the receiving waters (Harrington & Born, 1999-2000). Therefore, the municipal stormwater permit is an appropriate place to require a biological assessment (bioassessment) monitoring program. Section 303(c)(2)(B) of the Clean Water Act states that "States shall adopt criteria based on biological monitoring or assessment methods" and Section 304(a)(1) states that "States shall develop and publish criteria for water quality accurately reflecting the latest scientific knowledge... on the effects of pollutants on biological community diversity, productivity and stability" (Gibson, 1996 as referenced by Harrington & Born, 1999-2000). The Clean Water Act goes further than protecting human health as many chemical analyses are designed to do, by providing a mandate to protect aquatic life of the rivers and streams. Bioassessment is the only appropriate tool to use to monitor biological conditions of a waterway.

Historically, the biological component of monitoring has been overlooked, yet it seems that one of the fundamental and critical goals of the Clean Water Act is to protect the biological integrity of our streams and rivers. Yoder and Rankin believe "This narrow focus leads to an incomplete foundation in water resource policy and legislation (e.g., an emphasis on point sources and toxics) (1998)." Additionally, factors other than chemicals are now becoming responsible for the various listings of our Nations waters on the 303(d) list. These factors can include modification

or destruction of riparian and aquatic habitats, heavy sedimentation of the streambeds and benthic substrates, increased concentrations of nutrients, and the alteration of the natural stream flows, none of which can be clearly assessed through traditional chemistry tests. Bioassessment provides a tool by which to measure the health of the communities living within the stream by looking at population diversity, population composition (% taxa pollution tolerant, % taxa pollution intolerant), and other metrics that give us measures of the health and integrity of the population. The process of conducting Bioassessment also includes a physical habitat assessment, another component of stream health evaluation which is also overlooked in traditional water chemistry and toxicity monitoring.

Uses of Bioassessment in a Regulatory Framework

A Bioassessment program conducted by trained individuals is an unparalleled tool which provides crucial information about the biological conditions of a water body. Historically and mostly in Eastern States, the triad approach has been used and is still used today in assessing water quality. In this approach, water chemistry, physical habitat, and biological integrity are measured to give a true picture of the health condition of a water body. Chemistry alone, while valuable under some circumstances, is not adequate in measuring habitat or biological condition degradation. In a regulatory framework, the Aquatic Life Use Designation Workgroup of the US EPA, is working towards, and urging States, towards the development of biocriteria and the designation of stream health based solely on whether the stream has biological integrity or not. States such as Ohio have implemented this regulatory framework. Whether the state of California follows suite or not, bioassessment should be a necessary requirement of major NPDES permits.

The ultimate goal in developing statewide use of bioassessment is the development of biocriteria, and must be the direction our State is heading in. The development of biocriteria begins with the gathering of data, standardized classification of streams, and with regional geology, hydrology, etc. taken into consideration. The ideal methodology includes the identification of reference condition sites. In some cases, such as in the Los Angeles region, these reference condition sites may be rare or very isolated. In such cases the development of an Index of Biological Integrity (IBI) involves collecting and compiling data from all classifications of streams and then building a dose response curve to identify what the reference condition should look like. Although agencies such as the State Water Resources Control Board or California Department of Fish and Game would be the developers of IBIs, the data collected by other entities needs to be considered. State programs such as the Surface Water Ambient Monitoring Program will collect some data, but essentially, biological monitoring data collected as part of NPDES permits would provide essential supplemental data.

Other Uses Beneficial to the Permittee

In light of trying to assess each and every chemical component of stormwater runoff, a daunting task, bioassessment can also provide benefits to the permittee. Interpretation of the metrics discussed above can lend to trend analysis of the community. Many traits of the population can be inferred from the composition of the community. Rather than looking at individual test

results, inferences could be made from trend analysis to ~~can~~ determine if the situation is getting better or worse. This is very important as the Antidegradation Policy protects surface and ground waters from degradation. If surface waters of the State are continuing to be degraded, this must be documented.

Bioassessment provides a useful and cost effective tool to show that actions such as implemented Best Management Practices are working. Bioassessment can document an improvement of the biological integrity of the stream based on historical data and data collected after the implementation of a BMP. There are various ways bioassessment can be used as an adaptive management tool, including where to direct management dollars and identifying whether management dollars are being spent effectively.

Use of Bioassessment Statewide

Many NPDES permits, both POTWs and MS4s, are incorporating bioassessment monitoring into their water quality monitoring programs. The San Diego Region implemented a region-wide program under a contract with Fish and Game and has, as NPDES permits came up for renewal, incorporated responsibility for these stations into the permits. Bioassessment-specific language can be found in many permits state-wide, such as the San Diego and Santa Rosa municipal storm water permits, which contain very strong and elaborate bioassessment monitoring programs. The Ventura County permit also has a bioassessment component existing of 14-16 stations just in the Ventura River Watershed. This is an appropriate and legally justified requirement for the LA County storm water permit.

In Conclusion

Bioassessment is legally required by the Clean Water Act, although it has not been widely implemented. It can provide useful trend and baseline information during the period in which biocriteria are being developed, while being in itself, a crucial part of biocriteria development. While we cannot go back in time and gather historical data, we can, and should, gather data beginning this permit cycle and avoid delaying this process. Time is not on our side, as more and more waterways become degraded and pre-degradation data is lost forever. California has an opportunity to join other states that have already embarked in holistic assessment of water body conditions.

Some of the momentum has already been provided as a final cooperative agreement to establish a Southern California Stormwater Research/Monitoring Program has been executed between the City of Long Beach, Los Angeles County of Public Works, San Diego, Santa Ana and Los Angeles Regional Water Quality Control Boards, Ventura County Flood Control District, Southern California Coastal Water Research Project, San Diego County Stormwater Management Program, San Bernardino County Flood Control District, Riverside County Flood Control and Water Conservation District, and the County of Orange. Although I am encouraged to know the Scope of Work includes examining if biological indicators can be used to assess

the health of inland surface and coastal waters in Southern California and if biocriteria can be developed, these issues have already been examined and answered. The next step would be to require participation in a bioassessment program as a condition of the municipal stormwater permit.

Subject: RE: 6-4 Monitoring Meeting Agenda

HtB definitely has some major issues with the latest draft. We TOTALLY disagree with the elimination of the tributary monitoring program and the gutting of the biomonitoring requirements. Just what we need, another model when no one ever field verified the county's model. As for the IBI effort - the original monitoring language will get you there to help that effort. We need to start biomonitoring in this region. We have other concerns as well. On the benthic and sediment monitirng, we're ok with the concept but the spatial distribution recommendation (every 0.5 Km is too big and 25 sites is probably too many. Also, benthic monitoring needs to occur more than once every five years. The tox. language and the TIE/TRE requirements seem inconsistent with the mass emission station monitoring frequency (only one dry weather sample per year). Should we meet at 9 or 9:30 on Monday or do you just want to wing it?

Dear Mr. Dickerson:

RESPONSE TO PROPOSED ADDITION OF SHORELINE MONITORING PROGRAM TO THE MUNICIPAL NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM STORMWATER PERMIT

This is in response to Ms. Judith A. Wilson's letter (copy enclosed) regarding the City of Los Angeles' proposal to shift the Water Quality Shoreline Monitoring Program from the Hyperion National Pollutant Discharge Elimination System (NPDES) Discharge Permit to the Municipal NPDES Stormwater Permit. The County of Los Angeles is supportive of this proposal provided data collection and analyses and monitoring costs continue to be the sole responsibility of the City of Los Angeles as a condition of the Permit.

If you have any additional questions, please contact Mr. Mustafa Ariki at (626) 458-5948, Monday through Thursday, 7:30 a.m. to 6 p.m.

Very truly yours,

JAMES A. NOYES

Attention: Dr. Swamikanmu:

Enclosed is a proposal to shift the water quality shoreline monitoring program from the Hyperion NPDES discharge permit to the NPDES Municipal Stormwater permit now being written by your staff. This request was discussed and tentatively agreed upon during meetings on April 25th and 27th, 2001, with staff from the County of Los Angeles, City of Los Angeles, the RWQCB, and Heal The Bay.

If you have any questions, please contact Dr. John Dorsey of our staff at (213) 847-6347.

Sincerely,

James F. Langley for

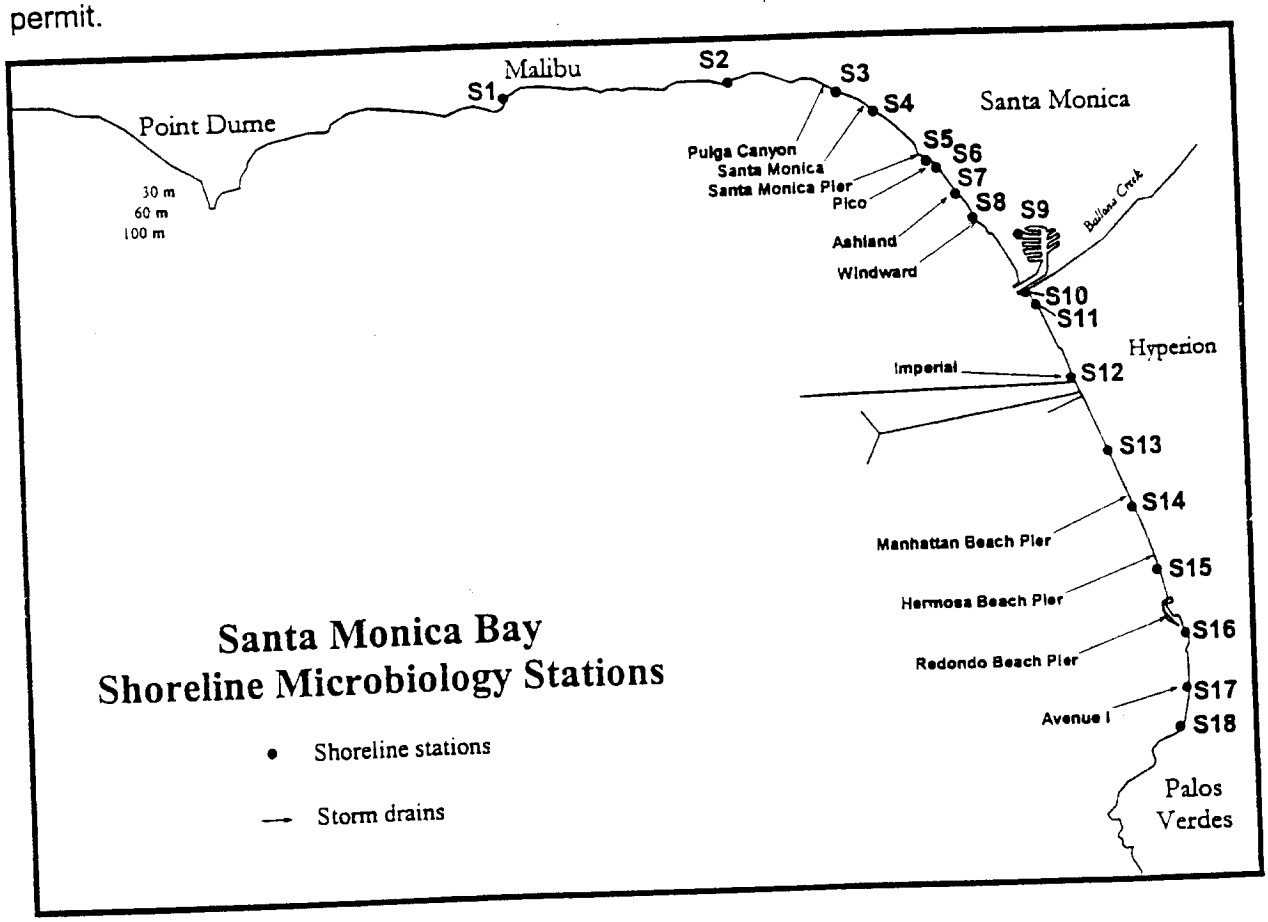
PROPOSAL TO SHIFT LOS ANGELES CITY SHORELINE MONITORING FROM HYPERION TO MUNICIPAL NPDES STORMWATER PROGRAM

BACKGROUND

The City of Los Angeles presently conducts daily water quality monitoring at 18 stations along the Santa Monica Bay shoreline see (map-figure). Samples are tested for total and fecal coliforms, and enterococci bacteria. This monitoring is required as part of the receiving water program for the Hyperion Treatment Plant, and was implemented decades ago to warn of effluent plumes reaching shoreline recreational waters.

Extensive shoreline and nearshore water quality monitoring since the 1960's demonstrated that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline. Rather, elevated bacterial counts are associated with runoff from storm drains, and discharges from piers. This situation was acknowledged by the RWQCB, EPA, and Heal The Bay when, in 1994, all agencies agreed to change the location of Hyperion's shoreline stations to implement a bay-wide, shoreline monitoring program under the auspices of the Santa Monica Bay Restoration Project. These stations, shown on the map below, continue to be monitored today under Hyperion's NPDES permit.



The shoreline monitoring conducted today is a program associated with storm drain runoff and geographically covers beaches in six municipalities – the cities of Malibu, Los Angeles, Manhattan Beach, Hermosa Beach, Redondo Beach, and Palos Verdes Estates, and the County of Los Angeles. As such, it rightfully belongs as a monitoring program element in the Municipal Stormwater Permit now being developed for the County of Los Angeles and Co-permittees.

PROPOSAL

We propose shifting the Santa Monica Bay shoreline monitoring program, now performed under the City of Los Angeles' NPDES permit for the Hyperion Treatment Plant (Permit No. CA0109991), to the municipal NPDES stormwater monitoring program now being developed by the RWQCB. The City of Los Angeles would continue performing the following monitoring, testing, and data transferring actions as part of the SMBRP regional program for the Bay:

- collect daily water samples at 18 stations,
- test samples for total and fecal coliforms, and enterococci bacteria,
- transfer data electronically to the Los Angeles County Department of Health Services (daily) and Heal The Bay (weekly), and
- provide County Public Works with an analysis of the data in electronic form for insertion into the Annual Stormwater Monitoring Report.

In the spirit of regional monitoring, the County will pursue cost-sharing arrangements for this program with the City and other municipalities on whose beaches monitoring is done.

LANGUAGE

We propose that the following language be inserted into the draft Municipal Stormwater permit to add a regional shoreline monitoring component. This language is similar to that used in the Hyperion permit.

A. Shoreline water quality monitoring for Santa Monica Bay.

A water quality monitoring program will be established along the shoreline of Santa Monica Bay to determine compliance with the State of California's bathing water standards for public beaches and ocean water-contact sport areas. These regulations were developed by the California Department of Health Services in response to requirements of Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765).

1. *Eighteen shoreline water quality stations shall be established along the shoreline of the Pacific Ocean within Santa Monica Bay. The stations shall be designated and located as follows:*

Station	Location[1]	Latitude	Longitude
S1	Surfrider Beach, Malibu, 50 yds E. of breech	34.03500	118.67833
S2	Topanga Point, Malibu, seaward of lifeguard station	34.03833	118.58083
S3	Pulga storm drain, Pacific Palisades, 50 yds E. of drain	34.03361	118.53417
S4	Santa Monica Canyon storm drain, Pacific Palisades, 50 yds E. of drain	34.02639	118.51861
S5	Santa Monica Pier, Santa Monica, 50 yds S. of pier	34.00833	118.49667
S6	Pico-Kenter storm drain, Santa Monica, 50 yds S. of drain	34.00583	118.49250
S7	Ashland storm drain, Santa Monica, 50 yds S. of drain	33.99639	118.48472
S8	Windward storm drain, Los Angeles, 50 yds S. of drain	33.98778	118.47750
S9	Marina Del Rey Beach, Marina Del Rey, at lifeguard tower.	33.98139	118.45833
S10	Ballona Creek, Playa Del Rey, 50 yds S. of south jetty	33.96083	118.45611
S11	Culver Blvd., extended, Playa Del Rey, N side of Culver storm drain	33.95639	118.45167
S12	Imperial Hwy. Storm drain, Playa Del Rey, 50 yds S. of drain	33.93028	118.43722
S13	El Porto, Manhattan Beach, 40th St. extended	33.90389	118.42250
S14	Manhattan Beach Pier, Manhattan Beach, 50 yds S. of pier	33.88360	118.41278
S15	Hermosa Beach Pier, Hermosa Beach, 50 yds S. of pier	33.86111	118.40278
S16	Redondo Pier, Redondo Beach, 50 yds S. of pier	33.83833	118.39111
S17	Ave. I storm drain, Redondo Beach, Ave. I extended, 50 yds S. of drain	33.81889	118.39111
S18	Malaga Cove, Palos Verdes Estates, Arroyo Circle extended	33.80500	118.39467

[1] Station locations from *Ocean Water Regulatory & Monitoring Protocol*, County of Los Angeles, Department of Health Services, May 5, 1999.

2. Type and Frequency of Sampling

The following tests will be performed on surface water collected at ankle depth from each location:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	Daily
Fecal coliforms	CFU or MPN/100 ml	Daily
Enterococcus	CFU or MPN/100 ml	5 times/month[1]

[1] Samples shall be taken at least once per week.

Shoreline sampling stations shall be occupied at the specified frequency during daylight hours. These samples can be omitted in the event of stormy weather that makes sampling hazardous.

3. Data assessment

Data collected shall be transmitted daily to the Los Angeles County Department of Health Services. Data shall be assessed annually and presented in the Annual Stormwater Monitoring Report produced by the Principal Permittee.

LA MS4 Monitoring Agenda
Pacific Ocean Room
Monday, June 4, 2001 10-noon

1. Discuss Significant Changes from First Draft (Justifications and Questions)

   a) Mass Emissions

      i.) SIP minimum levels for 1st storm of year
      ii.) Sample all storms (>.25 inch) for TSS
      iii.) 2 stations in Santa Clara

   b) Sediment Monitoring

      i.) Discuss objective: determine sediment fate and effect, allows for more accurate monitoring in future
      ii.) Discuss fit with regional monitoring - Bight-wide study components and objectives (Ken Schiff)

   c) Source ID Monitoring

      i.) Replaced Tributary Monitoring because it is an on-going effort that more clearly meets the objective of locating sources throughout the region

   d) Bioassessment

      i.) Justify change: need for index and reference conditions before data can be used to meet the objectives of the storm water monitoring program
      ii.) Explain development of regional effort - So. Cal. SW Research/Monitoring Program (Ken Schiff)
      iii.) Discuss index development (Ken Schiff)

Workplan for Pollutant Source Identification

Objectives

1. Identify pollutant source locations.
2. Prioritize locations that need management actions.
3. Provide baseline information for TMDL development.
4. Allocate pollutant loads for TMDL.

Approach

1. Identify tributary areas that drain into a major stream in each watershed.
2. Compute pollutant loads in each tributary area using the land use model, water quality and rainfall data.
3. Rank tributary areas by total loads and total loads per acre and select locations for the monitoring.
4. Monitor flow rate and water quality in selected tributary areas.
5. Calibrate the model using tributary flow and water quality data, then validate it with Mass Emission data.
6. Prepare pollutographs that show the pollutant loads on a seasonal and/or daily basis at each tributary area to provide necessary information for TMDL development.
7. Allocate pollutant loads among tributary areas.

Achievements

1. Computed total loads of metals in Ballona Ck., LA River, and SG River for 1994-2000.
2. Prioritized tributary areas by total loads and total loads per acre.
3. Selected 6 sampling locations that have high priority and flow measurement device.
4. Created a monitoring program. (6 stations (two of them are ME stations) + 5 storm events + 5 storm seasons = $600,000)
5. Performed source identification study and identified that three land use types produced approximately 60% loads. (Light Industrial: 26%, Retail/Commercial and Educational: 32%)

GENERAL WORKPLAN FOR WET WEATHER MODELING OF THE LOS ANGELES RIVER AND SANTA MONICA BAY WATERSHEDS

INTRODUCTION

The goal of this study is to develop a dynamic wet weather runoff model for the Los Angeles River and Santa Monica Bay watersheds. The objective of developing the wet weather runoff model is two-fold. The first objective is to evaluate what proportion of the cumulative runoff load of various constituents is generated from specific land uses, sub-watersheds, or municipal entities. This is important for prioritizing which locations may need management actions, targeting locations or sources that contribute sediments or sediment contaminants that impair dredging activities, or for assigning load and waste load allocations for total maximum daily loads (TMDLs). The second objective for developing a dynamic water quality model is to create a more sophisticated tool for assessing the effectiveness of different management actions.

Existing wet weather models in the Los Angeles region are static, which are too inflexible to assess the effects of potential management actions. Static models assume steady-state conditions and are most effective for estimating runoff loads on an annual or seasonal basis. However, flow and water quality during storm events is far from steady state and concentrations often range orders of magnitude within a single event. Dynamic models are time-variable and can incorporate these changes in water quality and flow over the course of a single storm event enabling a more accurate estimate of runoff mass emissions. Dynamic models use this time-variable interaction to assess complex processes and evaluate within storm management actions such as on-site stormwater retention strategies (e.g. SUSMPs).

A dynamic wet weather model uses rainfall, watershed hydrography, and runoff water quality data to predict the concentrations and loads of pollutants that runoff at the mouth of a sub-watershed. Both calibration and validation data need to be collected to develop the wet weather model. Three different types of calibration data are necessary: (1) physical data (i.e. elevation, storm drain piping, land use and soil type); (2) rainfall and flow data; and (3) water quality data. Of these, the water quality data is the biggest missing piece of information. Water quality data collected to date consists largely of event mean concentrations whereas a dynamic model needs information throughout the course of the storm. Time-concentration series are needed to show how constituents are mobilized from different urban surfaces and transported to receiving waters. Hence, the time-concentration series may vary from land use to land use and, depending upon local critical sources, may vary within land use types. Verification data, including flow and water quality, will be collected from selected sites along the mainstem of the river/creek and compared to the modeled estimates.

APPROACH

This document is meant to briefly outline the approach and data needed to develop the dynamic wet weather model. Since water quality data is the one piece of information most needed to develop the wet weather model, this document focuses on the strategy for obtaining time-concentration series at a variety of land use types.

Physical Data

Physical data are required to describe the model domain and set boundaries, route flow during storm events, and estimate runoff volumes. Elevation data and storm drain maps are used to define the watershed boundaries. Land use and soil data are used to help estimate the runoff volumes. Different land uses and soil types have different levels of imperviousness, which directly affect the amount of rain that will runoff into storm drain channels. GIS data layers for elevation, storm drain maps, soil type, and land use already exists and will be used for this portion of the model. The watershed boundaries will be compared to existing estimates of watershed boundaries used by other agencies.

Rainfall and Flow Data

Rainfall is the forcing function in the wet weather model. Fortunately, a relatively good array of rain gages exists in the Los Angeles region. There are over 70 rain gages (12 automatic) in the Los Angeles River watershed and more than 30 rain gages (3 automatic) in the Santa Monica Bay watershed. Two types of flow data are needed. The first type of flow data is from smaller areas of homogeneous land uses. Land use flow data will be used to generate runoff coefficients. Much of this data already exists and has been used to generate realistic runoff coefficients for this area. The second type of flow data is along the main stem of large rivers and creeks that represent the cumulative runoff from large, multiple land use areas. Much of this information has also been collected and used to verify runoff coefficients. However, the time-steps for rainfall and flow calibration have always been on a per-storm or per-wet year basis. The current dynamic model development will require rainfall, runoff, and flow at much finer time-steps (i.e. 15 min). Model calibration and validation for flow and volume will utilize existing data, but will model the rainfall-runoff relationships at the increased time step frequency.

Water Quality

Similar to flow, water quality will be collected at two different types of sites. The first are land use sites and the second are mainstem sites. Two mainstem sites already exist (LA River at Wardlow and Ballona Ck at Sawtelle) and we intend to collect time-concentration series at these historical sites. Land use sites are more numerous and most are not currently established.

Selection of Land Use Sampling Sites

There are eight basic land use types that need to be characterized for model development (Table 1). These include high density residential, low density residential, commercial, industrial, agriculture, transportation, recreational, and open lands. However, the concentrations of pollutants that are generated from each land use are a function of the critical sources within that land use. Therefore, we have adapted a sampling design that evaluates time-concentration series at replicate land use sites, which represents a range of sources within land use categories (Table 1). The range in time- concentration series will be used for model sensitivity analysis.

There are likely many factors that will influence a time-concentration series at a single site. This may include antecedent rainfall, intensity, and duration of rainfall, etc. Therefore, at a selected subset of sites we will be collecting time-concentration series during multiple storm events (Table 1). The range in time- concentration series during multiple storms will be used for model calibration.

Criteria for Site Selection

There are three categories of criteria that will be used for site selection. The first category focuses on sampling safety of field crew and includes access, protection from flooding, free from dangers such as traffic, enclosed space, and height. The second category of selection criteria focuses on flow measurements. Each site must have a well-defined drainage area and be hydrologically rateable for flow, which means that some flow control structure or device exists or can be deployed (i.e. cement lined open channel, pipe, weir, flume, etc.). The third category of criteria focuses on representativeness. Representativeness varies by site type. Mixed land uses will be considered representative if the plot size is greater than 10 acres and consists of more than 60% of the targeted land use within the drainage area. For critical source sites, no minimum size is designated since this will vary from source to source, but more than 90% of the drainage area must consist of the targeted land use. Where possible, use of existing monitoring locations is preferred.

Sample Collection

Ten time-paced samples are targeted at each site per storm event that should cover the entire range of a storm. For example, samples should be taken every hour for a 10 hr storm. It is recognized that rainfall and subsequent runoff flows are inherently unpredictable. Therefore, sample timing may not be precise and decisions in the field may be necessary. Flow measurements should be collected more frequently, preferably at 15 min intervals.

Target Constituents

The list of target constituents includes suspended solids, bacteria, nutrients, trace metals, organophosphorus pesticides, and polynuclear aromatic hydrocarbons (Table 2).

MODEL SELECTION

The Hydraulic Simulation Program – Fortran (HSPF) runoff model is the preferred model to dynamically simulate stormwater runoff. This model was chosen because of its complex time-variable rainfall-flow capabilities. This will enable varying stream flows and pollutant concentrations/loads during an event allowing evaluation of within storm management actions (e.g. stormwater retention). HSPF was originally developed by the US Geological Survey and has been widely tested in other watersheds. For example, HSPF is the runoff model that supports EPA's BASINS program. HSPF can also be linked with other receiving water fate and transport models. For example, HSPF can be easily linked to the Effluent Fluid Dynamics CODE (EFDC) that is being developed for the mainstem of the Los Angeles River and in Santa Monica Bay. HSPF supports the rapid time-variable steps used by EFDC.

PRODUCTS

A dynamic wet weather model will be used to create three different products for both the Los Angeles River and Santa Monica Bay watersheds. The first product will be a modeled estimate of cumulative mass emissions of suspended solids, bacteria, trace metals, organophosphorous pesticides, and polynuclear aromatic hydrocarbons for the various subwatersheds defined in the model. The proportion of the cumulative mass emissions from each of the eight different land use categories by subwatershed will also be generated. The second product will be a model sensitivity analysis based on the ranges in water quality information. The ranges of water quality information will be generated from the monitoring of different critical sources during this project. The third product will be an evaluation of three separate management actions. All three management actions will focus on stormwater retention strategies; on site retention of the first 0.25 in rain, the first 0.50 in rain, the first 0.75 in rain from all land uses. The differences in loads will be illustrated. Alternative management strategies, once designed, can be included in the model runs.

I. Monitoring Requirements

The primary objectives of the Los Angeles County Storm Water Quality Monitoring Program include, but are not limited to: 1) assessing compliance with this Order; 2) measuring and improving the effectiveness of the SQMPs; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality. Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMPs for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee shall implement the Countywide Storm Water Monitoring Program as follows:

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality objectives by comparing results to objectives in the Basin Plan, Ocean Plan, and with emissions from other dischargers.

1. The Principal Permittee shall monitor mass emissions from the following eight mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, the two stations in the Santa Clara River (one immediately upstream from the Ventura County line, and one upstream of the confluence with Castaic Creek. The Principal Permittee shall monitor the first storm event and a minimum of 3 additional storm events for each season. One dry weather sample per year at each mass emission station shall also be analyzed.

2. Samples for mass emission station monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms totaling 0.25 inches or greater of rainfall. Samples taken at mass emission stations during the first storm event should be analyzed for all constituents listed in Attachment 1. The Principal Permittee may elect not to sample Volatile Organic Compounds from the list of constituents for mass emission stations.

3. For the first storm of each year, method detection limits (MDLs) lower than or equal to the minimum levels identified in the State Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2000 (SIP) shall be used. These levels are listed in column A in Attachment 1. Where SIP minimum levels are detected, those

MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment 1, the higher MDLs may be used for the remaining sampling events of that year. If a constituent has been detected in 100 percent of samples during the last 2 years of monitoring, the Principal Permittee may continue to use the MDLs listed in column B until the constituent is not detected, afterwhich, the method detection limits shall be lowered to those in column A.

4. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment 1 in more than 25 percent of the first ten sampling events or on a rolling basis using ten consecutive sampling events, it need not be further analyzed, with the exception of the first storm of each season, unless the observed occurrences show high concentrations and are cause for concern.

5. All storms, in addition to those required above, totaling at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents (metals and PAHs are positively correlated with TSS).

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1.

The Principal Permittee shall analyze two wet weather samples and two dry weather samples from each mass emission station for toxicity per year. A minimum of one freshwater and one marine species shall be used for toxicity testing. Specifically, Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization shall be used. If toxicity is not detected in either of the dry weather samples for any given mass emission station, the Principal Permittee may reduce dry weather toxicity testing to one sample per year at that station. If toxicity is not detected in either of the wet weather samples for any given mass emission station, wet weather toxicity testing may be reduced to one sample from the first storm of the wet season per year at that station.

2. Toxicity Identification Evaluations (TIE)

The Principal Permittee shall conduct Phase I TIEs on wet weather samples when two consecutive samples from the same monitoring station show toxicity and on dry weather samples when two consecutive dry weather samples from the same monitoring station show toxicity.

3. Toxicity Reduction Evaluations (TRE)

The Principal Permittee shall perform a TRE for each pollutant or pollutant class that is identified as toxic. TREs shall include procedures for investigating the causes and identifying corrective actions to eliminate toxicity. Specifically, the following activities shall be included in each TRE:

- Identify the causative agents of toxicity (accomplished with the TIE)
- Isolate the sources of toxicity
- Evaluate the effectiveness of toxicity control options
- Implement effective toxicity control options
- Confirm the reduction in toxicity

If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds.

After the Principal Permittee has isolated the sources of toxicity and identified appropriate BMPs, each Permittee shall be responsible for implementing the appropriate BMPs to reduce toxicity. The Principal Permittee shall submit an implementation plan for each TRE to the Regional Board Executive Officer for approval.

During TRE development and implementation, the Principal Permittee shall continue monitoring the first storm and one dry weather event per year for toxicity at the subject station. Two years after BMPs have been implemented, , the Principal Permittee shall analyze two wet weather and two dry weather samples for toxicity to evaluate the effectiveness of the TRE.

The Principal Permittee shall conduct a maximum of two TREs per year. TRE performance shall be prioritized according to the TMDL schedule[1] and the level of toxicity present.

The Principal Permittee may use sampling data from previous storm water toxicity monitoring, however, all stations must conduct regular toxicity tests on the freshwater species Ceriodaphnia dubia where it was not previously conducted. For example, toxicity monitoring activities during the 2001-2002 permit year shall occur according to Table 1.

Table 1. Toxicity Monitoring Activities for 2001-2002

[1] Current TMDL schedule can be found on the Regional Board website at www.swrcb.ca.gov/rwqcb4/docs/table7_wmi_appdx.pdf

Monitoring Station	*Toxicity Monitoring Activities*
Ballona Creek	Zinc TRE, Copper TRE, toxicity testing on Ceriodaphnia dubia
Malibu Creek	Toxicity testing on Ceriodaphnia dubia, reduced testing on sea urchins
Los Angeles River	Wet and dry weather TIEs, toxicity testing on Ceriodaphnia dubia
San Gabriel River	Wet weather TIE, toxicity testing on Ceriodaphnia dubia
Dominguez Channel	Toxicity monitoring (2 wet and 2 dry weather on both species)
Coyote Creek	Toxicity monitoring (2 wet and 2 dry weather on both species)

The Principal Permittee shall report on the development, implementation, and results for each TRE in the Annual Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Sediment Monitoring

The Principal Permittee shall monitor estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertibrate communitiy to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary depicting the impacted areas shall be produced.

1. The Principal Permittee shall sample 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit cycle. Sediment samples shall be taken at each station by means of a 0.1m2 (1.1 ft 2) modified Van Veen sediment grab sampler. Sample sites shall be placed at approximately 1/2 kilometer intervals.

2. The Principal Permittee shall also sample 25 sites outside of each direct outfall to assess cumulative effects.

3. All samples shall be analyzed for the following:

   a) Sediment Chemistry (priority pollutants)

   b) Total Organic Carbon (TOC)

   c) Grain size

   d) Sediment Toxicity

      (1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.

      (2) Phase I TIEs of interstitial water, using Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.

e) Benthic Macroinvertibrates

(1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.

(2) The Principal Permittee shall identify all organisms to lowest possible taxon.

(3) The Principal Permittee shall determine the Total Biomass of:

(i) Mollusks
(ii) Echinoderms
(iii) Annelids/polychaetes
(iv) Crustaceans
(v) All other macroinvertebrates

(4) The Principal Permittee shall determine the community structure analysis , including wet weight of each taxonomic group (listed above), number of species, number of individuals per species, total numerical abundance, species abundance per grab, species richness, species diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index[2].

4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water. The Principal Permittee is encouraged to undertake this requirement in parallel with the Regional Monitoring (Bight-wide 03 study, conducted by SCCWRP).

D. Source Identification Monitoring

The Principal Permittee shall participate in an on-going effort[3] to develop a dynamic wet weather runoff model using time-concentration series. The immediate goal of the monitoring is to determine the proportion of the cumulative runoff load of various constituents generated from specific land uses (critical sources), sub-watersheds, or municipal entities. The ultimate goal is to jointly develop a model that can be regionally applied to

[2] Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the Southern California Coastal Water Research Project
[3] General Workplan for Wet Weather Modeling of the Los Angeles River and Santa Monica Bay Watersheds, DPW, SCCWRP, Regional Board

target locations or sources that contribute pollutants, prioritize locations that need management actions, and assign loads and waste load allocations for TMDLs

1. The Principal Permittee shall develop and implement a source identification monitoring program that will provide data for the development of the dynamic wet weather runoff model. Specific land use or critical source sites shall be chosen consistent with those listed in Table 1 of the General Workplan for Wet Weather Modeling of the Los Angeles River (Attachment 4?). Site selection shall be coordinated with the existing effort. The Principal Permittee may reconfigure existing land use and/or critical source stations for use, where appropriate.

2. The Principal Permittee shall monitor a minimum of any 10 site events. For example, 1 event from 10 different critical source sites, or 5 events from 2 different sources may be monitored. Each site event shall include10 time-paced samples to cover the entire range of the storm. For example, samples should be taken every hour for a 10 hour storm.

3. Each sample shall be analyzed for constituents that exceed standards at the respective mass emission station, TSS, bacteria, nutrients, trace metals, organophosphorus pesticides, and PAHs

4. The Principal Permittee shall submit the data to the appropriate agency for use in development of the model. Data, results, and analysis shall also be submitted to the Regional Board Executive Officer with Annual Reports.

E. Shoreline Monitoring

The Principal Permittee shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from urban runoff. This component should be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the State of California's bathing water standards for public beaches and ocean water-contact sport areas[4], and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

   a) The eighteen established shoreline water quality stations listed in Attachment 2 shall be monitored;

   b) Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	Daily
Fecal coliforms	CFU or MPN/100 ml	Daily
Enterococcus	CFU or MPN/100 ml	5 times/month

   c) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;

   d) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches, as approved by the Los Angeles County Department of Health Services (DHS).

   e) Data collected shall be transmitted daily to the Los Angeles County DHS. Data shall be assessed annually and presented in the Annual Report;

   f) When exceedances of public health standards for bacteria occur, the Principal Permittee shall notify the appropriate Permittees. Permittees shall initiate an investigation to determine the source, as required in the Program to Eliminate Illicit Connections and Discharges (Part 4.F.2.c.).

   g) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the Santa Monica Bay Restoration Project regional program for the Santa Monica Bay.

F. Regional Monitoring

The Principal Permittee shall participate on Regional Monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources.

[4] California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the Southern California Bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. Many of these components correspond to parameters required to be measured under this Order. A similar Bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this Bight-wide monitoring project. The sampling and analytical efforts and data collected may be substituted for equivalent requirements of this Monitoring Program for that year, such as the sediment mapping (Section C.4).

G. Bioassessment

The Principal Permittee shall participate in a regional effort to develop an Index of Biological Integrity (IBI) for Southern California streams, including determining reference conditions and natural variability in this region. The Regional Board anticipates that the Southern California Stormwater Research/Monitoring Program (coordinated by SCCWRP) will organize a regional effort to evaluate the biological index approach for Southern California and to design a research project for developing an IBI by 2003. The ultimate goal is to have a bioassessment tool sufficiently developed so that data can be used to measure stream health, identify biological responses to pollution and probable causes of impairment by the end of this Order.

H. Trash Monitoring

The Principal Permittee and the Permittees listed in Attachement 3 shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds. At a minimum, Permittees shall determine the annual trash load in cubic feet per year. The Principal Permittee is encouraged to implement the program in the watersheds that are not presently listed on the 303(d) list for impairment for trash.

I. Peak Discharge Impact Study

The Principal Permittee shall participate in a study to evaluate peak storm water discharge rate (PDR) control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization (Part 4.C.2.). The Principal Permittee may partner with the Ventura County Flood Control District to extend their stream erosion study to a watershed in Los Angeles County that contains primarily natural drainage systems, specifically the Santa Clara River.

J. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control storm water best management practices. The objectives of this study shall include the following:

- Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year preceding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.
- Evaluate the requirements, feasibility and cost of maintenance for each BMP.
- Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the Santa Monica Bay Restoration Foundation's proposed study, "Performance Evaluation of Structural BMPs for Storm water Pollution Control in the Santa Monica Bay Watershed" to meet this requirement. Participation includes collaboration and resource contribution to expand the scope of the proposed study.

K. Standard Monitoring Provisions

1. The Principal Permittee shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

   Records of monitoring information shall include:

a) The date, exact place, and time of sampling or measurements;

b) The individual(s) who performed the sampling or measurements;

c) The date(s) analyses were performed;

d) The individual(s) who performed the analyses;

e) The analytical techniques or methods used; and,

f) The results of such analyses.

2. All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.

3. All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

4. If no flow occurred during the reporting period, the monitoring report shall so state.

5. For any analyses performed for which no procedure is specified in the EPA guidelines or in this Monitoring and Reporting Program, the constituent or parameter analyzed and the method or procedure used must be specified in the monitoring report.

6. Whenever feasible, all MDLs shall be less than or equal to the Minimum Levels in the State Water Resources Control Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2000. If this is not feasible, the Principal Permittee shall use analytical methods with the lowest MDL.

7. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring and Reporting Program, after providing the opportunity for public comment, either:

a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the Annual Monitoring Program Report. Such petition shall be filed not later than 60 days after the Annual Monitoring Program Report submittal date, or

b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.

Mr. Dennis Dickerson, Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013

Dear Mr. Dickerson,

Support for Stakeholder Consensus-Building Process, Los Angeles County Permit

The California Storm Water Quality Task Force is writing this letter to support the County of Los Angeles and municipal co-permittees' request to develop a census-building process to efficiently address concerns surrounding the proposed Los Angeles municipal storm water National Pollutant Discharge Elimination System permit.

The Storm Water Quality Task Force was formed in 1989 to provide guidance to the State Water Resources Control Board on the development of NPDES permit and related regulatory guidelines for storm water discharges. In this capacity, we have assisted the State Board in the development and implementation of the storm water permitting process. Our membership is primarily composed of storm water quality managers from cities, counties, and special districts throughout California. We have representation from public agencies that serve approximately 22 million people in California.

The Task Force believes forming a consensus-building format will not only assist the Regional Board staff, the public, environmental groups and your Board in addressing contested and

competing concerns within the community, but also assist the stakeholders in understanding all the issues and concerns, of all the stakeholders.

A professional process facilitator should create a forum that will bring together regulatory, municipal, business and environmental stakeholders with a common goal of finalizing a Storm Water Quality Management Program and permit for the area to reduce pollutants in urban storm water to the maximum extent practicable. The Task Force views this as an opportunity to create a model approach in resolving the complicated issues presented in developing municipal storm water permits and other related regulatory initiatives, such as Total Maximum Daily Load implementation plans.

We have an interest in the proposed process and outcome of the Los Angeles County municipal storm water permit to the extent it may provide a model or precedent for the development and content of future permits in other areas. At the Regional Board's request, the Task Force will identify a representative from the proposed permit area, or from another region, to represent the Task Force and provide a broader perspective of professional, municipal storm water quality managers.

The Task Force believes that the proposed process will allow for openly and fairly resolving complicated and far-reaching storm water permit issues. Storm water managers and regulators must bring together all the stakeholders and work toward sensible solutions that will achieve tangible storm water pollution reductions.

We would appreciate being kept apprised of progress in this matter and the time and location of scheduled consensus-development sessions. Adequate lead-time will permit us to fully participate. If you have any questions, please call me at (559) 456-3292.

Respectfully,

Melinda Marks
Chair

Subject: Re: shoreline monitoring

Hi Megan: Mark told me that EMD would be willing to measure Enterococcus daily provided they would be allowed to use test kits in lieu of membrane filtration. I'm checking with Ing-Yih Cheng about this. As soon as I verify this info with him, I'll let you know.

John

>>> "Megan Fisher" <Mfisher@rb4.swrcb.ca.gov> 06/05/01 10:40AM >>>
Hi John,

At yesterday's meeting, Mark Gold made the comment that enterococcus needs to be monitored daily. I think you mentioned that the City usually does it daily, anyway. Are you ok with "daily" instead of "5 times/month" in the permit?

Thanks,
Megan

The NPDES Municipal Storm Water Permit – What's Next

Presentation to the
City and County Engineers Meeting

Significant Permit Changes - draft dated May 29, 2001

	Existing Permit	Proposed Permit
Receiving Water Limit	Limit set at MEP (maximum extent practicable).	Limit set at MEP (maximum extent practicable). Should quality of receiving water fail to meet Basin Plan objectives, Permittees must revise their Storm Water Quality Management Plan.
Structure	Enforcement: Includes 'NTMC' provision TMDLs: No requirement Implementation deadlines: vary	Enforcement: NTMC provision deleted TMDLs: Must implement, without reopening the permit Implementation: Must implement most new program requirements within 180 days (will consider exceptions, given just cause)
Monitoring	Mass emissions (5 stations) Land uses Receiving water studies in Ballona and Malibu Creeks Critical source identification	Add 3 mass emissions stations; lower detection limits for comparison with CTR standards (first storm of each year only, assuming no problems). Wet weather source Identification monitoring (to validate land use and source model) Add TSS sampling of 8 stations (every storm, to measure variability). Participate in biomonitoring (a regional study, led by SCCCRP); also participate in Southern CA bight, led by SCCWRP. Shift shoreline monitoring from the Hyperion permit to this permit – City of LA will be responsible Trash monitoring

	Existing Permit	Proposed Permit
Special Provisions		
--Public Info	Relies on site visits to heavy and light industrial facilities and to RGOs (retail gasoline outlets) and restaurants.	Replaced by corporate outreach (RGOs) and small business assistance
--Inspections	Not required.	[Under review]
--Land Development	New SUSMP requirement, with a 100,000 ft^2 threshold.	Lower SUSMP threshold to 1 acre in 2003 (consistent with Phase 2) CEQA: Expand requirement to review discretionary projects to also include ministerial projects Add new categories: ■ RGOs ■ ESAs
--Construction	Local SWPPPs for sites 2 to 5 acres Inspections – not required	Local SWPPPs required for sites 1 acre and above Wet weather inspections required for sites 1 acre and greater.
--Public Agency Activities	Except for street sweeping, performance measures tend to be vague.	Reduce trash through specified requirements for catch basin cleanout (40%), open channel cleanout (100%), street sweeping (2x/month, but increasing to 4x/month in high priority areas). LA and Ballona watersheds must also meet TMDL requirements to reduce trash to zero. Cities' industrial and construction projects will no longer be covered under the MS4; rather, such projects must obtain coverage under the State's general permits.
--IC/ID Elimination	Passive inspection program. Not sure what or how much of the storm drain system has been screened.	Prioritize problem areas, and implement an active screening program to eliminate illicit connections and discharges.

LA County MS4

Proposed Renewal Schedule * (Revised on May 29, 2001)

Thursday, April 12th	Issue first draft of permit/staff report (containing technical basis)
Tuesday, April 24th	Conduct workshop at Los Angeles Central Library Auditorium, 630 W. 5th St., Los Angeles, from 9:30 - 12:30 • Workshop Notice • Workshop Agenda
Wednesday, May 16th	Comments due on first draft
Friday, June 29th	Issue second draft, staff report, and Response to Comments
Thursday, July 26th	Workshop at Board Meeting (location TBA)
Monday, August 6th	Written comments on second draft due
Thursday, Sept 6th	Issue Tentative draft and Response to Comments
Friday, Sept 28th	Written comments on final draft due
Friday, Oct 11th	Issue Response to Comments
Thursday, Oct 25th	Propose adoption at Board Meeting (location TBA)

Subject: Santa Clara station

Hi Carolina,

At our meeting yesterday, we discussed the need for further information about the Santa Clara River. Here's what I've found out so far:

First, the Saugus Water Reclamation Plant discharges upstream from Bouquet Canyon. They monitor the Santa Clara River above and below the discharge point, the downstream station appears to be at, or just above, the confluence with Bouquet Canyon. Their monitoring is independent of rain events, but they monitor some constituents daily and weekly so some of the data could be useful. However, the station location is too far upstream to represent mass emissions. I'm still unclear on what the monitoring at the upstream station consists of, but depending on the state of development up there, it could possibly provide some baseline data (flow, if nothing else). I need to more thoroughly look at their monitoring report.

Second, I have a call in to Newhall, but from what I know so far, most of the area near the County line won't be developed for many years. Therefore, it may not be necessary to install a station as far downstream as the County line to capture mass emissions. But we would want to make sure it would be representative of mass emissions for long enough that it would be worth installation. Evidently, the USGS will be installing a new gauging station near the 5 and Hwy 99. It sounds like an accessible place, but we need to check into current and projected development to determine if it would be far enough downstream. According to the Ventura County FCD, there is an abandoned gauge near the County line, and there is a pretty new USGS gauge installed on a bridge near Piru, in Ventura County. The bridge is on the Newhall property. I don't know what your constraints are regarding private property, but this location would ideal for characterizing mass emissions from LA County. I have the location, so we can check it out in the field.

That's all for now. Let me know if you have any questions. Also let me know if anyone there is planning a site visit. If it's next week, Monday and Thursday are best for me.

Thanks,
Megan

Subject: 6-8 Monitoring Draft

The latest draft of the monitoring program is attached. We would like to meet (RB and County only) to discuss the draft prior to the issuance of the second draft of the permit, on June 29. Please respond with a possible meeting date for the week of the 18th. June 18 or 19th are the most open for Xavier and I.

Please do not distribute the attached draft outside of your office.

Thank you,
Megan Fisher

I. Monitoring Program

The primary objectives of the Los Angeles County Storm Water Quality Monitoring Program include, but are not limited to: 1) assessing compliance with this Order; 2) measuring and improving the effectiveness of the SQMPs; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality. Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMPs for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee shall implement the Countywide Storm Water Monitoring Program as follows:

CORE MONITORING

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality objectives by comparing results to objectives in the Basin Plan, Ocean Plan, and with emissions from other dischargers.

1. The Principal Permittee shall monitor mass emissions from the following eight mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and two stations in the Santa Clara River (one as close to the Ventura County line as practicable, and one near the confluence with Mint Canyon). The Principal Permittee shall monitor the first storm event and a minimum of 2 additional storm events for each season. A minimum of two dry weather samples per year at each mass emission station shall also be analyzed.

2. Samples for mass emission station monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms totaling 0.25 inches or greater of rainfall. Samples taken at mass emission stations during the first storm event should be analyzed for all constituents listed in Attachment 1. The Principal Permittee may elect not to sample Volatile Organic Compounds from the list of constituents for mass emission stations.

3. For the first storm of each year, method detection limits (MDLs) lower than or equal to the minimum levels identified in the State Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2000 (SIP) shall be used. These levels are listed in column A in Attachment 1. Where SIP minimum levels are

detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment 1, the higher MDLs may be used for the remaining sampling events of that year. If a constituent has been detected in 100 percent of samples during the last 2 years of monitoring, the Principal Permittee may continue to use the MDLs listed in column B until the constituent is not detected, afterwhich, the method detection limits shall be lowered to those in column A.

4. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment 1 in more than 25 percent of the first ten sampling events or on a rolling basis using ten consecutive sampling events, it need not be further analyzed, with the exception of the first storm of each season, unless the observed occurrences show high concentrations and are cause for concern.

5. All storms, in addition to those required above, totaling at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents and provide a more accurate estimate of median mass emissions (metals and PAHs are positively correlated with TSS).

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze two wet weather samples and two dry weather samples from each mass emission station, except for the reference station in the Santa Clara River, for toxicity per year. A minimum of one freshwater and one marine species shall be used for toxicity testing. Specifically, Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization shall be used. Only Ceriodaphnia dubia shall be used for toxicity testing of samples from the Santa Clara mass emission station. If toxicity is not detected in either of the dry weather samples for any given mass emission station, the Principal Permittee may reduce dry weather toxicity testing to one sample per year at that station. If toxicity is not detected in either of the wet weather samples for any given mass emission station, wet weather toxicity testing may be reduced to one sample from the first storm of the wet season per year at that station.

2. Toxicity Identification Evaluations (TIE)

The Principal Permittee shall conduct Phase I TIEs on wet weather samples when two consecutive samples from the same monitoring station show toxicity and on dry weather samples when two consecutive dry weather samples from the same monitoring station show toxicity.

3. Toxicity Reduction Evaluations (TRE)

The Principal Permittee shall perform a TRE for each pollutant or pollutant class that is identified as toxic. TREs shall include procedures for investigating the causes and identifying corrective actions to eliminate toxicity. Specifically, the following activities shall be included in each TRE:

Identify the causative agents of toxicity (accomplished with the TIE)
Isolate the sources of toxicity
Evaluate the effectiveness of toxicity control options
Implement effective toxicity control options
Confirm the reduction in toxicity

If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds.

After the Principal Permittee has isolated the sources of toxicity and identified appropriate BMPs, each Permittee shall be responsible for implementing the appropriate BMPs to reduce toxicity. The Principal Permittee shall submit an implementation plan for each TRE to the Regional Board Executive Officer for approval.

During TRE development and implementation, the Principal Permittee shall continue monitoring the first storm and one dry weather event per year for toxicity at the subject station. Two years after BMPs have been implemented, , the Principal Permittee shall analyze two wet weather and two dry weather samples for toxicity to evaluate the effectiveness of the TRE.

The Principal Permittee shall conduct a maximum of two TREs per year. TRE performance shall be prioritized according to the TMDL schedule[1] and the level of toxicity present.

The Principal Permittee may use sampling data from previous storm water toxicity monitoring, however, all stations must conduct regular toxicity tests on the freshwater species Ceriodaphnia dubia where it was not previously conducted. For example, toxicity monitoring activities during the 2001-2002 permit year shall occur according to Table 1.

Table 1. Toxicity Monitoring Activities for 2001-2002

Monitoring Station	***Toxicity Monitoring Activities***
Santa Clara River	Toxicity Monitoring (Ceriodaphnia dubia)
Ballona Creek	Zinc TRE, Copper TRE, toxicity testing on Ceriodaphnia dubia
Malibu Creek	Toxicity testing on Ceriodaphnia dubia, reduced testing on sea urchins

[1] Current TMDL schedule can be found on the Regional Board website at www.swrcb.ca.gov/rwqcb4/docs/table7_wmi_appdx.pdf

Los Angeles River	Wet and dry weather TIEs, toxicity testing on Ceriodaphnia dubia
San Gabriel River	Wet weather TIE, toxicity testing on Ceriodaphnia dubia
Dominguez Channel	Toxicity monitoring (2 wet and 2 dry weather on both species)
Coyote Creek	Toxicity monitoring (2 wet and 2 dry weather on both species)

The Principal Permittee shall report on the development, implementation, and results for each TRE in the Annual Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Tributary/Source Identification Monitoring

The Principal Permittee shall monitor select tributaries to identify sources of pollutants in subwatersheds, prioritize locations that need management actions, provide baseline information for TMDL development and allocate pollutant loads for TMDL development. A second purpose of this monitoring is to validate the Land Use Model.

1. The Principal Permittee shall develop and implement a tributary/source identification monitoring program, focusing on metals in the Los Angeles River, San Gabriel River, and Ballona Creek Watersheds. The following tributaries which have been identified as contributing the greatest loads of metals per acre in each subwatershed (based on the last four years of data for land use type, area, and rainfall) shall be monitored:

   a) Centinela Creek (Ballona Creek WMA)
   b) Kenter Canyon (Ballona Creek WMA)
   c) Aliso Creek (Los Angeles River WMA)
   d) Bull Creek (Los Angeles River WMA)
   e) Compton Creek (Los Angeles River WMA)
   f) Los Cerritos Channel (San Gabriel River WMA)
   g) San Jose Creek (San Gabriel River WMA)
   h) Coyote Creek (San Gabriel River WMA)[2]

2. The Principal Permittee shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

3. All samples for tributary stations may be taken as grab samples or with an automatic sampler. Samples shall be taken just upstream of the tributary's confluence with the mainstem. For each storm event, a minimum of 5 samples, during the first 3 hours, shall be composited. Constituents to be analyzed for each location shall include the following:

   a) pH, dissolved oxygen, temperature, conductivity, and total suspended solids

[2] Mass emission data from Coyote Creek station can be used

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) Flow

4. For the first storm of each year, method detection limits (MDLs) lower than or equal to the minimum levels identified in the SIP shall be used. These levels are listed in column A in Attachment 1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment 1, the higher MDLs may be used for the remaining sampling events of that year.

5. The Principal Permittee shall submit a report identifying sources and/or source areas of pollutants within each watershed and priority management actions as part of the fourth Annual Report, to be submitted in 2005. The SQMP shall be modified to reflect the identified priority management actions.

D. Shoreline Monitoring

The City of Los Angeles shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from urban runoff. This component should be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the State of California's bathing water standards for public beaches and ocean water-contact sport areas[3], and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

a) The eighteen established shoreline water quality stations listed in Attachment 2 shall be monitored;

b) Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	Daily
Fecal coliforms	CFU or MPN/100 ml	Daily
Enterococcus	CFU or MPN/100 ml	Daily

c) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;

d) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches, as approved by the Los Angeles County Department of Health Services (DHS).

e) Data collected shall be transmitted daily to the Los Angeles County DHS.

[3] California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765

Data shall be assessed annually and presented in the Annual Report;

f) When exceedances of public health standards for bacteria occur, the Principal Permittee shall notify the appropriate Permittees. Permittees shall initiate an investigation to determine the source, as required in the Program to Eliminate Illicit Connections and Discharges (Part 4.F.2.c.).

g) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the Santa Monica Bay Restoration Project regional program for the Santa Monica Bay.

E. Trash Monitoring

The Principal Permittee and the Permittees listed in Attachment 3 shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds.The Principal Permittee is encouraged to implement the program in the watersheds that are not presently listed on the 303(d) list for impairment for trash.

REGIONAL MONITORING

F. Regional Monitoring

The Principal Permittee shall participate on Regional Monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources.

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the Southern California Bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. A similar Bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this Bight-wide monitoring project. The sampling and analytical efforts and data collected may be used to complete the estuary sampling requirement described below in Section G.

The Principal Permittee shall also continue participation on the Southern California Stormwater Research/Monitoring Program committee (coordinated by SCCWRP). The Regional board anticipates that this program will organize an effort to evaluate the biological index approach for Southern California and to design a research project for developing an Index of Biological Integrity (IBI) for this region by 2003. The Principal Permittee shall participate in this regional effort to complete the bioassessment monitoring requirement described below in Section F.

G. Estuary Sampling

The Principal Permittee shall sample estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertibrate communitiy to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary which depicts the impacted areas shall be produced. The maps shall provide the information necessary to conduct effective sediment monitoring to determine trends and accumulation, as a future permit requirement.

1. The Principal Permittee shall sample a maximum of 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit cycle. Sediment samples shall be taken at each station by means of a $0.1m^2$ ($1.1\ ft^2$) modified Van Veen sediment grab sampler.

2. The Principal Permittee shall also sample a total of 25 sites outside of the direct outfalls to assess cumulative effects.

3. All samples shall be analyzed for the following:
   a) Sediment Chemistry (priority pollutants)
   b) Total Organic Carbon (TOC)
   c) Grain size
   d) Sediment Toxicity
      (1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.
      (2) Phase I TIEs of interstitial water, using Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.
   e) Benthic Macroinvertibrates
      (1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.
      (2) The Principal Permittee shall identify all organisms to lowest possible taxon.
      (3) The Principal Permittee shall determine the Total Biomass of:
         (i) Mollusks
         (ii) Echinoderms
         (iii) Annelids/polychaetes
         (iv) Crustaceans
         (v) All other macroinvertebrates
      (4) The Principal Permittee shall determine the community structure analysis , including wet weight of each taxonomic group (listed above), number of species, number of individuals

per species, total numerical abundance, species abundance per grab, species richness, species diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index[4].

4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water. The Principal Permittee is encouraged to undertake this requirement in parallel with the Regional Monitoring (Bight-wide 03 study, conducted by SCCWRP).

H. Bioassessment

The Principal Permittee shall participate in a regional bioassessment effort, including conducting bioassessment monitoring. The purpose of this requirement is to detect biological trends in receiving waters and to collect data for the development of an IBI for Southern California. The ultimate goals of bioassessment are to assess the biological integrity of receiving waters, to detect biological responses to pollution, and identify probable causes of impairment not detected by chemical and physical water quality analysis.

1. The Principal Permittee shall coordinate with regional efforts and with the Surface Water Ambient Monitoring Program (SWAMP) being developed by the Regional Board to identify a total of 20 bioassessment stations within Los Angeles County.

2. Station selection shall be complete within one year from the date this Order is adopted, and sampling shall begin in October of 2003.

3. Each bioassessment station shall be monitored annually, in October of each year, beginning in October 2003. A minimum of three replicate samples shall be collected at each station during each sampling event.

4. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized "Non-point Source Bioassessment Sampling Procedures" for professional bioassessment as set forth in the California Department of Fish and Game California Stream Bioassessment Procedure (CSBP)[5]. Results of the Bioassessment Monitoring shall be reported annually as part of the Annual Report. Results shall include:

   a) All physical, chemical and biological data collected in the assessment;

   b) Photographic documentation of assessment and reference stations;

   c) Documentation of quality assurance and control procedures;

[4] Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the Southern California Coastal Water Research Project

[5] California Stream Bioassessment Procedure (Protocol Brief for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game - Aquatic Bioassessment Laboratory, May 1999. Located at www.dfg.ca.gov/cabw/protocols.html.

d) Analysis that shall include calculation of the metrics used in the CSBP;

e) Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;

f) Electronic data formatted to the California Department of Fish and Game Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database.

5. A professional environmental laboratory shall perform all sampling, laboratory, quality assurance, and analytical procedures.

SPECIAL STUDIES

I. New Development Impacts Study in the Santa Clara Watershed

The Principal Permittee and the City of Santa Clarita shall monitor tributaries in the Santa Clara watershed to determine impacts from new development and to compare storm water quality between subwatersheds with and without SUSMPs.

1. The Principal Permittee and the City of Santa Clarita shall select one station that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation, and one station (SUSMP station) in a subwatershed in which the majority of the development has/will include SUSMP implementation. Other inputs to runoff, such as septic systems, in the two subwatersheds should be similar. The upstream mass emission station may serve as the SUSMP station, if it is appropriate based on development projections in the Santa Clara watershed.

2. The Principal Permittee and the City of Santa Clarita shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

3. All samples may be taken as grab samples or with an automatic sampler. For each storm event, a minimum of 5 samples, during the first 3 hours, shall be composited. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, chloride, nitrogen, and TSS

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) Pathogen Indicators (Coliform)

4. For the first storm of each year, method detection limits (MDLs) lower than or

equal to the minimum levels identified in the SIP shall be used. These levels are listed in column A in Attachment 1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment 1, the higher MDLs may be used for the remaining sampling events of that year.

5. The Principal Permittee and the City of Santa Clarita shall submit an analysis of the data, including a description of each watershed, year-to-year changes compared to the amount of development that occurred in each, comparisons between stations, and an analysis of SUSMP effectiveness, with the fifth year annual report.

J. Peak Discharge Impact Study

The Principal Permittee shall participate in a study to evaluate peak storm water discharge rate (PDR) control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization (Part 4.C.2.). The Principal Permittee may partner with the Ventura County Flood Control District to extend their stream erosion study to a watershed in Los Angeles County that contains primarily natural drainage systems, specifically the Santa Clara River.

K. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control storm water best management practices. The objectives of this study shall include the following:

Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year preceding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.

Evaluate the requirements, feasibility and cost of maintenance for each BMP.

Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the Santa Monica Bay Restoration Foundation's proposed study, "Performance Evaluation of Structural BMPs for Storm water Pollution Control in the Santa Monica Bay Watershed" to meet this requirement. Participation includes collaboration and resource contribution to expand the scope of the proposed study.

L. Standard Monitoring Provisions

1. The Principal Permittee shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used

to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

Records of monitoring information shall include:

a) The date, exact place, and time of sampling or measurements;

b) The individual(s) who performed the sampling or measurements;

c) The date(s) analyses were performed;

d) The individual(s) who performed the analyses;

e) The analytical techniques or methods used; and,

f) The results of such analyses.

2. All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.

3. All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

4. If no flow occurred during the reporting period, the monitoring report shall so state.

5. For any analyses performed for which no procedure is specified in the EPA guidelines or in this Monitoring and Reporting Program, the constituent or parameter analyzed and the method or procedure used must be specified in the monitoring report.

6. Whenever feasible, all MDLs shall be less than or equal to the Minimum Levels in the State Water Resources Control Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2000. If this is not feasible, the Principal Permittee shall use analytical methods with the lowest MDL.

7. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring and Reporting Program, after providing the opportunity for public comment, either:

   a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the Annual Monitoring Program Report. Such petition shall be filed not later than 60 days after the Annual Monitoring Program Report submittal date, or

   b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.

Mr. Dennis Dickerson
California Regional Water Quality Control Board
Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Re: Request for Facilitative Review Process

Dear Mr. Dickerson:

We have received your correspondence of May 30, 2001, explaining your reasons for not accepting our joint request for a Los Angeles Storm Water Permit Facilitator. For your information, we have received positive responses regarding participating in the facilitative review process from the following organizations:

The County of Los Angeles
The California Stormwater Quality Task Force
The Executive Advisory Committee
The Building Industry Association of Southern California.

Copies of letters confirming some of these organizations' desire to participate in the proposed process are enclosed. Also, please note, the Coalition has yet to receive a negative response to the proposal.

We were surprised that you were not receptive to the concept described in our letter, especially in light of the dialogue at the recent Board meeting over the lack of State resources needed to complete the Board's program in a timely manner and even more so given the support our proposal has received in such a short period of time. In light of this, we would ask that you reconsider your position and put it in abeyance until a majority of the parties have had sufficient opportunity to consider the concept. We do not see the logic of holding numerous separate "sessions" with interested stakeholders, as opposed to group sessions with an agreed-upon facilitator, if a majority of the interested stakeholders support the proposal.

2175 Cherry Avenue ♦ Signal Hill, CA 90806 ♦ (562) 989-7302 ♦ (562) 989-7393 Fax

Your letter also indicated that a "significant number of public comments" had been received on the Municipal NPDES Permit. Given this, the added workload would lend itself to assistance. Our hope is that the facilitator would assist both you and the Board in the NPDES Permit process.

Your letter indicated that the Second Draft of the Permit will be released on June 29th and that the draft should resolve "many" of the current issues. We would only hope this would be the case, but history has led us to believe that your staff does not place a priority on resolving the issues of importance to the cities and other members of the regulated community. A good example of what we view as the "anti city" bias in the current process is the draft permit requirement that cities implement an expensive GIS computer mapping system for illicit discharges. We had two meetings with your staff to explain the high costs of implementing the GIS system and to put forward viable alternatives, but found that the GIS requirement is still contained in the latest draft permit.

Your letter stated that you intend to "participate in as many sessions" as possible with the cities and other interested parties during the first three weeks in July. Your desire is to "discuss any remaining areas where consensus has not been achieved." The Coalition certainly appreciates efforts that will result in solving the problems and reaching consensus. However, again, we would ask that you reconsider having a series of "sessions" with individual stakeholders in favor of having several facilitated group sessions. In addition, we have three concerns with the "sessions" as outlined in your letter. The first is the limited amount of time devoted to these "sessions." You only have two weeks to physically meet with all interested parties, since many individuals plan vacations around the July 4th Holiday and the holiday falls midweek this year. This leaves a very limited amount of time to reach consensus on the number of comments received prior to the Board Workshop.

Our second concern is who will be participating in these "sessions." Typically you have met ***individually*** with the various groups, with no opportunity for any of the interest groups to come together to understand each other's concerns and to dialogue toward solutions. In the past, this was the case because the environmental groups, for unknown reasons, refused to meet with other interested stakeholders. Recall, that it was this very approach that led to the petition on the SUSMP and the hearing before the State Board. At that time, in the course of the hearing before the State Board, there was no reasonable explanation given for the "shuttle diplomacy" you engaged in, and the Coalition believes there should be nothing to hide and no reason to not have the issues discussed openly in group facilitated sessions. We are willing to meet with the

environmental groups and Regional Board staff, and would hope the environmental groups are willing to do the same. If not, we would like an explanation as to why the environmental groups are unwilling to meet jointly, in order to avoid the same problems and questions that arose in connection with the SUSMP.

Furthermore, often times in the past, we did not receive feedback on the concerns from other stakeholders from your individual sessions. Further, the feedback we do receive was "second" and "third hand", perhaps not expressing the exact concerns of the individual parties. Again, we believe it is important to avoid miscommunication and to resolve the issues ahead of time, rather than subsequently through litigation. Also, we would like to obtain a copy of your proposed session schedule for calendaring purposes.

The third concern is the nature of staff "participation". We have found in past meetings that there is limited staff dialogue and discussion, and that there is no consideration of the "pros" and "cons" of the permit requirements. For example, the Draft Permit includes a series of staff recommended "enhancements" to the current permit. Yet, there have been nine meetings to discuss our concerns with these "enhancements" already, and the cities spent countless hours reviewing the merits and problems of these "enhancements" with your staff. In ***every*** case, your staff decided to include these enhancements in the Draft Permit. There was no dialogue or explanation of why these enhancements were necessary. If we do not reach consensus on the issues, the next goal of your sessions should be that all parties come away with a mutual understanding of each party's positions. Mutual understanding can only be forged with honest and frank discussions, which the Coalition is committed to.

The Coalition hopes that your personal commitment and involvement will make a difference on this permit. We feel the need to be honest and forthright about our past concerns, so that the problems of the past can help guide the deliberations into the future. The Coalition extends our facilitation offer to help you and the Board throughout this permit process and over the next several months. We look forward to working with you in this process, and to hearing from you on the above.

Sincerely,

Larry Forester

May 23, 2001

Mr. Dennis Dickerson, Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013

Dear Mr. Dickerson:

REQUEST FOR NPDES PERMIT FACILITATOR

The Coalition for Practical Regulations is proposing a facilitated consensus building process in developing the final draft of the 2001 Los Angeles Municipal Storm Water Permit. The Los Angeles County Flood Control District as Principal Permittee and the County of Los Angeles as Permittee support that request.

The District and the County strongly support the Regional Board's goal of a permit which will result in great strides being made to restore the beneficial uses of our water bodies. We believe that, for the permit to be effective, it must have the full support of all the stakeholders. Appeals, lawsuits and lack of support, whether it is by municipalities, interest groups or regulators, will only delay our efforts to implement on a comprehensive basis.

Should you agree to the Coalitions request, we will participate fully with the intent to resolve all issues/concerns with the draft permit in a timely manner that does not delay implementation.

Your consideration is appreciated. You may contact me at (626) 458-4014.

Very truly yours,

JAMES A. NOYES

June 4, 2001

Mr. Dennis Dickerson, Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013

Dear Mr. Dickerson,

Support for Stakeholder Consensus-Building Process, Los Angeles County Permit

The California Storm Water Quality Task Force is writing this letter to support the County of Los Angeles and municipal co-permittees' request to develop a census-building process to efficiently address concerns surrounding the proposed Los Angeles municipal storm water National Pollutant Discharge Elimination System permit.

The Storm Water Quality Task Force was formed in 1989 to provide guidance to the State Water Resources Control Board on the development of NPDES permit and related regulatory guidelines for storm water discharges. In this capacity, we have assisted the State Board in the development and implementation of the storm water permitting process. Our membership is primarily composed of storm water quality managers from cities, counties, and special districts throughout California. We have representation from public agencies that serve approximately 22 million people in California.

The Task Force believes forming a consensus-building format will not only assist the Regional Board staff, the public, environmental groups and your Board in addressing contested and

competing concerns within the community, but also assist the stakeholders in understanding all the issues and concerns of all the stakeholders.

A professional process facilitator should create a forum that will bring together regulatory, municipal, business and environmental stakeholders with a common goal of finalizing a Storm Water Quality Management Program and permit for the area to reduce pollutants in urban storm water to the maximum extent practicable. The Task Force views this as an opportunity to create a model approach in resolving the complicated issues presented in developing municipal storm water permits and other related regulatory initiatives, such as Total Maximum Daily Load implementation plans.

We have an interest in the proposed process and outcome of the Los Angeles County municipal storm water permit to the extent it may provide a model or precedent for the development and content of future permits in other areas. At the Regional Board's request, the Task Force will identify a representative from the proposed permit area, or from another region, to represent the Task Force and provide a broader perspective of professional, municipal storm water quality managers.

The Task Force believes that the proposed process will allow for openly and fairly resolving complicated and far-reaching storm water permit issues. Storm water managers and regulators must bring together all the stakeholders and work toward sensible solutions that will achieve tangible storm water pollution reductions.

We would appreciate being kept apprised of progress in this matter and the time and location of scheduled consensus-development sessions. Adequate lead-time will permit us to fully participate. If you have any questions, please call me at (559) 456-3292.

Respectfully,

Melinda Marks
Chair

Executive Advisory Committee

Storm Water Program – Los Angeles County

June 11, 2001

Mr. Dennis Dickerson
Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013-1105

REQUEST FOR LOS ANGELES STORM WATER PERMIT

Dear Mr. Dickerson:

This letter is to request that you approve a facilitation process to help the Reginal Water Quality Control Board solicit and address concerns from various stakeholders regarding the proposed Los Angeles Municipal Storm Water Permit (Permit). This facilitation process will bring regulatory, municipal, business and environmental stakeholders together with the common goal of determining the most effective measures to include in the Permit to address the region's storm water quality concerns.

The facilitator for this process should be selected based on input from the various stakeholders and would not require any funding from the Regional Water Quality Control Board. It is also understood that this facilitation process will not necessarily be binding. Your Board will still maintain all rulemaking authority. However, the information developed in the process should prove to be invaluable in compiling a consensus permit.

We trust that you will look favorably on this proposal to bring stakeholders together during Permit development. The facilitation process will accomplish bringing stakeholders together earlier in the process resulting in a shorter, less contentious Permit adoption at the Board meeting.

Sincerely,

Desi Alvarez
Chairman
Executive Advisory Committee

Subject: June 25 Monitoring meeting

The meeting to discuss all outstanding issues regarding the monitoring program prior to the issuance of the second draft has been scheduled for Monday, June 25 at 2pm, here in the Pacific Ocean Room.

Mustafa, Xavier has requested that we invite Don Wolfe, to make sure that all outstanding issues are resolved.

Please let me know if you have any questions, or problems with the schedule. Also, feel free to propose an agenda with the specific issues you'd like to discuss.

By the way, we have not invited other parties to this meeting.

Thanks,
Megan Fisher

Los Angeles, CA 90013

RE: Preliminary Revised Draft of the Monitoring and Reporting Requirements of the Stormwater Management/Urban Runoff Discharges NPDES Permit for Los Angeles County Flood Control District, County of Los Angeles and Cities of Los Angeles County

Dear Dr. Swamikannu:

Thank you for the opportunity to further comment on the Stormwater Management/Urban Runoff Discharges NPDES Permit for Los Angeles County. Our major concerns at this point are with the estuary monitoring program, toxicity monitoring requirements and tributary monitoring requirements.

1. Toxicity Monitoring at Mass Emissions Stations and TIEs

Table 1 is confusing. How can a TIE be conducted on water that was found to be toxic three years ago? We recommend deleting Table 1 and requiring regular toxicity monitoring with both test species for all watersheds, unless there is a TRE currently underway.

Lack of toxicity at a site for two sampling events in one year does not justify reduced testing at that site. Stormwater discharge is highly variable, and two samples per year may miss some toxic discharges. The program should not therefore be reduced to even fewer samples per year. Furthermore the draft monitoring program requires a TIE when two consecutive dry-weather or two consecutive wet-weather samples show toxicity, but only one dry-weather and one wet-weather sample may be required for toxicity testing after the first year. Even if this protocol detects toxicity at a site, it may not trigger a TIE for a given site in a single year. Nor will it provide sufficient information to determine causes of toxicity. We recommend:

A. two storm samples and two dry-weather samples must be tested for toxicity every year;

B. since little is known about the causes of toxicity in stormwater, a TIE should be triggered whenever a single sample shows toxicity, for the life of this permit. Toxicity is indicated by an amphipod survival rate of 70% or less in a single test.

By the end of the permit cycle, the County and the Regional Board will have a great deal more information on the causes of toxicity in the watersheds with mass emissions sites.

2. Estuary Monitoring

We recommend annual sediment toxicity testing and benthic community analysis at five sites in estuaries of at least the Los Angeles River, Ballona Creek and the Dominguez Channel. Once in the life of this permit may be sufficient for the Malibu Creek and San Gabriel River estuaries because these receiving waters are not listed for impacts to benthic communities or sediment contamination. Fewer sites may be used in the estuary mapping studies (e.g. 15 sites instead of 25) to make annual

info@healthebay.org
www.healthebay.org

monitoring feasible. During the year that the Principal Permittee participates in the Bight Wide Study, annual sediment toxicity and benthic community analyses need not occur.

3. Tributary Monitoring

Tributary monitoring should not focus only on metals. No rationale is provided for this. L.A. County watersheds are impaired for metals and a variety of other constituents. Since the primary purposes of this monitoring are to identify sources of pollutants in subwatersheds, prioritize locations that need management actions, and provide baseline information for TMDL development, tributary monitoring should include all constituents for which the waterbody is impaired. We recognize that economic concerns are the rationale for excluding Dominguez Channel and Malibu Creek, but these two watersheds must be included in the tributary monitoring program somehow. The Permittee should be required by this permit to obtain tributary monitoring data for these watersheds through their involvement in ongoing watershed assessment efforts, such as the Dominguez Channel Watershed Advisory Council and the Malibu Creek Watershed Committee. We recommend tributary monitoring for all listed constituents be required in the San Gabriel River, Los Angeles River and Ballona Creek, and that this permit specify similar data be obtained for Dominguez Channel and Malibu Creek.

4. Reporting Requirements

In addition to written reports, all data must be submitted electronically in a format that can be easily managed by the Regional Board.

Thank you again for the opportunity to comment on Stormwater Management/Urban Runoff Discharges NPDES Permit for Los Angeles County.

Sincerely,

Mark Gold

Mr. Donald L. Wolfe
Assistant Director
County of Los Angeles Department of Public Works
900 South Fremont Avenue, 11th Floor
Alhambra, California 91803-1331

Dear Mr. Wolfe:

Our staff has recently approached your staff to initiate discussions on an opportunity to fund local agencies in assisting the State to ensure compliance with the State's *General Permit for Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities* (Order No. 97-03-DWQ; NPDES No. CAS000001; hereafter General Permit). The purpose of this letter is to propose conceptual terms for a contract, or Memorandum of Agreement (MOA), to work with local agencies to address storm water issues at industrial facilities in the County of Los Angeles. As you are aware, facilities in industrial sectors specified by the US Environmental Protection Agency are subject to requirements of the State's General Permit.

Our objectives for this proposal are to: (1) ensure that permittees enrolled under the General Permit are in compliance with permit requirements and other local storm water requirements, and (2) identify industrial facilities that have failed to enroll under the General Permit. To accomplish this, we have roughly outlined terms of a proposal with the County, as summarized below.

Objective 1: Ensure Compliance – We envision that the key tasks under this objective will include:

Task 1A: Compliance Inspections – There are approximately 2,600 permittees in the County, whom we want to inspect on an annual basis for the purpose of ensuring compliance with our General Permit. Please note that, by ensuring the Permittees comply with the State's General Permit, we also would be ensuring compliance with local storm water ordinances and with local agencies' model programs.

Task 1B: Sampling – This task would be a logical sequence to the critical source monitoring that the County has already completed, to compare the quality of runoff in five high risk industrial sectors. There are other sectors in need of such an evaluation. Moreover, sampling is important to determine the effectiveness of permittees' best management practices. Accordingly, we would like to set aside contract funds to sample runoff.

Task 1C: Referrals – Based on the results of compliance inspections and the sampling program(s), the County would refer violations to the Regional Board for informal and formal enforcement action. As Regional Board staff develop enforcement cases, the County would assist the Regional Board's enforcement efforts through various supporting activities, including but not limited, to: searches for current owners, operators, and lessees, appearances as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Objective 2: Identify Non-filers – We envision that the key tasks to accomplish this objective will include:

Task 2A: Data Review – The existing and draft municipal storm water permits require local agencies to help identify non-filers. We would like the County to review the data compiled to date, and develop an inspection strategy to confirm that the identified facilities are subject to the General Permit requirements.

Task 2B: Non-filer Field Checking – We would like the County to field-check each facility identified by Task 2A above, to confirm industrial activities and to provide warning to the facility owner/operator of the filing requirements required by the General Permit.

Task 2C: Referrals – Based on the results of referrals in Task 2B above, the County would refer non-filer violations to the Regional Board for informal and formal enforcement action. As Regional Board staff develop enforcement cases, the County would assist the Regional Board's enforcement efforts through various supporting activities, including but not limited, to: searches for current owners, operators, and lessees, appearances as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

We have not yet had opportunity to discuss in sufficient detail the structure of a contract or MOA, and the level of funding. Regarding the structure of an MOA, to date we have talked only briefly about the Regional Board contracting with the County, and with the County then subcontracting with the Cities of Los Angeles and Long Beach. Regarding the inspection authority of local agencies, we believe that the MOA could be structured to allow delegation of our inspection authority to local agencies. Regarding the cost, your staff indicated that they could develop some estimates of cost-per-inspection based upon the level of inspection – for this reason, we are enclosing a copy of our compliance inspection checklist. Also, you explained that the County would want to be reimbursed on an hourly basis, as opposed to a per inspection, or

flexibility in this regard, and I have requested Mr. John Youngerman at the State Board to assist us on this issue.

We are excited about this opportunity to work with local agencies to enhance our storm efforts and work toward our long-term goal of changing the behavior and practices on the part of industry. We would be pleased to meet with you and your staff to address details of this conceptual proposal. Please do not hesitate to contact me (213-576-6605), Wendy Phillips, Chief of our Storm Water Section (213-576-6618) or Xavier Swamikannu, Chief of our LA Coastal Storm Water Unit (213-576-6654).

Sincerely,

Dennis A. Dickerson
Executive Officer

From: "Wessel, Ann" <awes461@ECY.WA.GOV>
To: "'Dan Radulescu'" <DRADULES@rb4.swrcb.ca.gov>
Date: 6/18/01 11:40AM
Subject: FW: BMPs for gas stations

Dan - Sorry this response is late, we are barely keeping up with our work load here and have little time to spare. I'm forwarding a response Ed O'Brien sent to Phil Hammer that covers questions similar to yours.

I'll try to add answers to questions that aren't covered in Ed's e-mail. (Stan - Could you please try to add in answers to questions 2 and 3 below, thanks. Also any other questions you have more info about, thanks again.)

1. Why are Retail Gas Outlets specified as a development category that must treat stormwater? - All new development is required to treat stormwater.

2. What was the justification and basis for the categorization of RGOs as a priority category or in other way as a contributor or potential contributor of pollutants in the stormwater runoff? STAN - In there anything in the new manual identifying gas stations as a priority????

3. What are the pollutants of concern in untreated stormwater runoff from RGOs in your opinion?
STAN - Could you please answer this.

Questions 4 - 7 covered by Ed - for more detail see 1992 and draft 2000 Ecology stormwater manuals.

8. Estimated cost of stormwater controls at RGOs - We don't have any information on this.

9. What percent approximately of the RGO area is taken up by treatment control BMPs? This will depend on the type of BMPs used.

10. When did RGOs first become subject to new development requirements for stormwater treatment? The first Ecology stormwater manual was published in 1992, many jurisdictions began to enforce it shortly after publication. In July 1995 we issued municipal stormwater permits to phase 1 municipalities that included a requirement to apply the provisions in the manual.

11. Has the implementation of treatment control BMPs at RGOs improved the quality of stormwater discharges in your jurisdiction?
We don't have monitoring data designed to answer that question.

12. What mechanism do you use to ensure that the treatment BMPs are properly maintained? The municipal stormwater permits require that the permittee maintain all publicly owned stormwater treatment and flow control BMPs, which would include fueling stations at public motor pools, etc. Also, permittees are required to adopt and implement an ordinance (and in the upcoming permit an inspection program) to ensure maintenance of all privately-owned stormwater treatment and flow control BMPs.

Subject: RE: BMPs for gas stations

Ed,
I'm not sure if I ever replied to your response, but I wanted to make sure to thank you for your help. Your response to my question was extensive and helpful in many ways. We have recently passed a municipal NPDES storm water permit which requires new gas stations to implement structural BMPs. The permit's requirements for new gas stations are similar to those in your manual. The Western States Petroleum Association has appealed the permit, stating that structural BMP implementation is infeasible at new gas stations. Its interesting they never mentioned in their appeal that they already meet similar requirements in many places within the State of Washington. So much for their argument of infeasibility. Thanks again for your help.
-Phil

>>> "O'Brien, Ed" <eobr461@ECY.WA.GOV> 03/27/01 12:44PM >>>
Phil,

I will explain the requirements to you. First, I want to make sure you understand their applicability and regulatory context.

Our stormwater manual requirements apply to new development and redevelopment, not necessarily to existing gas stations that are not undergoing substantial redevelopment.

1. Municipalities covered under the Phase I municipal stormwater NPDES permits must adopt a manual equivalent to the State's stormwater manual. So new and redeveloped gas stations in those areas must meet our manual requirements.

2. Municipalities that do not have an NPDES municipal stormwater permit, and are in the Puget Sound Basin, are supposed to adopt an equivalent manual as required by the Puget Sound Water Quality Management Plan. However, that plan does not have an enforcement or penalty mechanism, so some municipalities do not comply, and therefore do not require gas stations to meet our manual requirements.

3. Municipalities outside Puget Sound are encouraged to use the manual, but are not required to use it.

Because gas stations are not required to get an NPDES permit for their stormwater runoff, the state does not review building permit applications for gas stations. So, we do not know the extent to which local governments are implementing the manual for gas stations. We do know that over 50% say that they are applying the manual.

OK, now what does the manual require?

The 1992 manual would require a new or redeveloped gas station to meet all of the minimum requirements. The most significant ones are:

Erosion and sediment control during construction (15 erosion and sediment control requirements)

Source Control BMPs for the developed site (BMP S1.10 - includes details for fuel island construction, covering the island, preventing stormwater run-on to the island, and the ability to trap spills. I can fax it to you if you don't have it.)

Treatment BMPs for the developed site. The gas station would probably have to apply an oil/water separator and a conventional BMP for solids removal. See Volume I pages I-4- 9 and -10. The treatment BMPs are sized to handle the runoff from a 6-month, 24-hour storm, which can be estimated as 65% of a 2-year, 24-hour storm. The runoff is primarily coming from areas outside of the covered fuel island and the roof.

Flow control BMPs for the developed site. If the runoff from a gas station goes to a stream directly or indirectly (e.g., by discharging to a municipal storm drain that leads to a stream), the discharge must be controlled to the level required by Minimum Requirement #5.

The proposed 2001 manual would require a new or redeveloped gas station to meet all of the new minimum requirements. The most significant ones are:

Erosion and sediment control during construction (12 erosion and sediment control elements) requirements.

Source Control BMPs for the developed site (BMP S1.10 has been updated)

Treatment BMPs for the developed site. The gas station would have to apply an oil control BMP off of our Oil Control Menu in Volume V, and at least a Basic Treatment BMP from our Basic Menu in Volume V. If the discharge was directly or indirectly (as explained above) to a surface water other than what we refer to as a "major receiving water body," a BMP or BMP's from our Enhanced Treatment Menu would have to be selected. The BMPs would be sized to handle the 6-month, 24-hour storm which is now estimated to be 72% of the 2-year, 24-hour storm. However, because roof runoff is not considered a pollution generating surface, it would not have to be directed into the treatment BMPs.

Flow Control BMPs for the developed site. The gas station would have to meet Minimum Requirement #7 - Flow control. The flow control requirement is significantly more stringent than the '92 manual requirement.

The only item left to discuss is what is required of existing gas stations that are not undergoing redevelopment. Currently, there aren't any programmatic approaches to require all gas stations to do anything. However, there are two possible legal vehicles to use to make progress on pollution control at existing gas stations. First, we are drafting a reissued Phase I municipal stormwater permit that would require local governments to inspect industrial/commercial operations with a certain frequency. Where they see a pollution problem, we want them to have the authority to require application of structural source control BMPs, as well as treatment BMPs. The use of BMPs at these sites may also be dictated by a stormwater basin plan that recommends actions to solve pollution and

hydrologic problems for a particular receiving water.

Secondly, the Dept. of Ecology has to develop Wasteload Allocations and Load Allocations as part of the TMDL process for solving pollution problems in 303(d) listed waterbodies. Where gas stations are a source of a pollutant that is causing a water quality standards violation, they may be required to retrofit source control and/or treatment BMPs.

We have not encountered any specific opposition to these requirements by the gas station industry. We have had the structural source control requirement since 1992. We are adding a minimum requirement for mobile fueling operations that generated a lot of discussion with local fire departments and the fueling industry. But that seemed to work out ok.

The proposed Volume I of the 2001 manual is available on our website at www.ecy.wa.gov/biblio/9911.html. Volumes II - V are at 9912.html through 9915.html respectively. Volume IV has the detail for the proposed update to BMPS 1.10 that details structural source controls for gas stations.

That's about what I can think of at the moment, Phil. I hope I didn't forget anything. Good luck!

Ed

Subject: BMPs for gas stations

Mr. O'Brien,
I work for the California Regional Water Quality Control Board in San Diego. About a month ago, I talked with you about the State of Washington's regulations for flow impacts to wetlands resulting from new development. You were very helpful in providing me with information on the issue.

I have another brief question for you regarding Washington's requirements for structural BMPs at gas stations. As I understand it from your Volume I, most gas stations would be required to meet minimum requirements 1-10, including implementation of structural BMPs. Is this correct? If so, have you received opposition from gas station interest groups on these requirements? Also, what type of structural BMPs do you see implemented at gas stations?

We are trying to impose similar requirements on gas stations and have received strong opposition from them. I am trying to get an understanding of what other areas are doing to address them. Any information you may have would be greatly appreciated.

Thanks,
-Phil Hammer

Re: Information on retail gasoline outlets or fuel dispensing facilities

---

Enclosed is a copy of the City of Portland stormwater management manual (chapter 9) that address retail gasoline outlets or fuel dispensing facilities.

If you have any questions, please contact Kelly Hendryx at (503) 823-7585

2001 JUN 22 P 2:19

9.2 FUEL DISPENSING FACILITIES

9.2.1 Applicability

The requirements in this section apply to all development where vehicles or equipment are refueled on the premises—whether a large-sized gas station or a single-pump maintenance yard. They do not apply to propane tanks.

A fuel dispensing facility is defined as the area where fuel is transferred from bulk storage tanks to vehicles, equipment, and/or mobile containers (including fuel islands, above-ground fuel tanks, fuel pumps, and the surrounding pad).

Applicants subject to these requirements shall prepare a **Form SPC** located at the end of this chapter) that fulfills the requirements of Section 9.2.3, below, and include it in their submittal package.

NOTE: Mobile fueling operations require authorization by BES's Industrial Stormwater Permitting Section and may have specific SPC requirements not identified in this chapter. These types of operations are typically used for construction activities or other limited-duration projects.

9.2.2 Issue

Fuel dispensing facilities are a potential source of chronic loading and acute releases of pollutants to the environment. Stormwater runoff from fuel dispensing facilities may contain oil and grease, toxic hydrocarbons, heavy metals, and other pollutants.

9.2.3 Requirements

The following SPCs are required for fuel dispensing operations, unless an equivalent alternative is requested on Form SPC and approved by BES.

1) COVER

The fuel dispensing area shall be covered with a permanent canopy, roof, or awning so precipitation cannot come in contact with the fueling area. Precipitation shall be directed from the cover to a stormwater disposal system that meets all applicable code requirements.

- **Covers 10 feet high or less** shall have a minimum overhang of 3 feet on each side. The overhang shall be measured relative to the perimeter of the hydraulically isolated fueling area it is to cover.

- **Covers higher than 10 feet** shall have a minimum overhang of 5 feet on each side. The overhang shall be measured relative to the perimeter of the hydraulically isolated fueling area it is to cover.

This SPC should be implemented in conjunction with prevention of stormwater run-on into the covered area.

2) PAVEMENT

A paved fueling pad shall be placed under and around the fueling activity. The pad shall be sized to adequately cover the activity area, including placement of the vehicle or piece of equipment to be fueled.

Gasoline and other materials can react with asphalt pavement, causing the release of toxic oils from the pavement. It is therefore preferable to pave the area with Portland cement concrete. If the area is already paved with asphalt, an asphalt sealant shall be applied to the pavement surface. Whichever paving material is used, the paved surface shall be properly maintained to prevent gaps and cracks.

3) DRAINAGE

The paved area beneath the cover shall be hydraulically isolated through grading, berms, or drains. This will prevent uncontaminated stormwater from running onto the area and carrying pollutants away. Drainage from the hydraulically isolated area shall be directed to an approved City sanitary sewer, an approved on-site industrial wastewater treatment facility, or other approved on-site temporary storage facility or containment device/structure.

Note: An on-site temporary storage facility or containment device/structure shall be used only as a last resort and only for temporary storage of the wastewater or contaminated stormwater (*see Appendix 9-B*).

If a water pollution control facility permit (WPCF) is required by DEQ and results in changes to the facility, Source control must be given copies of these changes.

4) SIGNAGE

Signage shall be provided at the fuel dispensing area and shall be plainly visible from all fueling activity areas (*see section 9.1.7).*

The following language shall be added to the building plan set, as a general note on the site and/or utility plan:

> "Signage will be provided at the fuel dispensing area that is plainly visible and water resistant, and includes the following information:
>
> - Safety precautions
> - Immediate spill response procedures
> - Emergency contacts and telephone numbers"

5) SEDIMENTATION MANHOLE

A sedimentation manhole shall be installed on the discharge line of the fueling pad (before the domestic waste line tie-in). The manhole shall be located on property. For more information about sedimentation manholes, refer to the City's *Standard Construction Specifications Book,* detail 4-11.

The requirement for a sedimentation manhole prior to sanitary discharge is to help achieve local discharge limitations applicable to the City's sanitary sewer. (See *Appendix 9-A* for more information about sanitary sewer discharge limits.)

Design Retrofit of Sedimentation Manhole: The outlet of the manhole will need to be revised to reflect a tee installation, with a removable watertight cap for cleaning. The tee must extend downward approximately 18 inches. This feature is to help capture oils and greases.

6) SHUT-OFF VALVE

A shut-off valve shall be installed downstream of the sedimentation manhole, before the domestic waste line tie-in. The shut-off valve must be located on property. For more information about shut-off valves and associated valve boxes, contact the City's Commercial Plumbing Department at 503-823-7302.

This requirement is to comply with City Code, Chapter 17.34.090, requiring spills that occur within the activity area to be effectively contained for appropriate clean-up and disposal. (The emergency contacts and responders identified on the required signage shall determine the appropriate clean-up and disposal of a spill.)

7) ADDITIONAL REQUIREMENTS

Please carefully review the following additional requirements. These requirements are not applicable to all development projects. If they do apply, however, and are not addressed in the project design, revisions will be required. This could delay issuance of related building permits.

A) **Above-ground fuel tanks** are subject to additional requirements (*see Section 9.3*).

B) **Additional oil controls** may be required for vehicle traffic, parking, and storage areas if the facility is defined as a higher-use or higher-risk site (*see Section 9.8*).

C) **Bulk fuel terminals** require an additional review process to determine regulatory authority and requirements.

8) EXCEPTIONS

A) The requirement to cover the fuel dispensing area can be waived if the fuel dispensing area is generally used to service oversized equipment (e.g., cranes) that cannot maneuver under a roof or canopy.

City Code (Chapter 17.32.080 and 17.32.090) prohibits stormwater from being discharged to a City separated sanitary sewer, with limited exceptions allowed by the Chief Engineer. If approval is granted and a cover is not installed because of oversized equipment, Chapter 17.36 of the City Code allows the City of Portland to bill a facility for the disposal of stormwater into the City separated sanitary sewer. Charges are determined by either calculated volumes (based on the average annual rainfall and the square footage of impervious area drained) or by meter readings from a City-approved discharge meter.

A written **stormwater volume charge request** will be required as part of the approval process for this exception. The written request shall document the property owner's acknowledgement of the City's right to charge the facility sanitary sewer rates for the volume of stormwater discharged to the sanitary sewer system. The application shall be signed by the property owner and notarized.

B) Propane tanks are exempt from requirements #1 through 5 in 7.2.3. Traffic protection crash posts shall be placed at a maximum spacing of 5 feet on all sides of the AST where traffic patterns may exist and a containment wall is not present.

(back to top)

9.8 VEHICLE AND EQUIPMENT TRAFFIC AREAS, PARKING, AND STORAGE

9.8.1 Applicability

The requirements of this section apply to all types of parking lots (commercial, public, and private), retail store parking lots, fleet vehicle lots and yards (including rental car lots and car dealerships), equipment sale and rental lots, and access roads with any of the following **higher-use** or **higher-risk** conditions:

- A commercial or industrial site subject to an expected average daily traffic (ADT) count equal to or greater than 100 vehicles per 1,000 square feet of gross building area.
- A commercial or industrial site subject to use, storage, or maintenance of a fleet of 25 or more vehicles or equipment (trucks, buses, heavy equipment, etc.).
- A commercial or industrial area identified for the specific use and traffic from vehicles or equipment that are over 10 tons gross weight (trucks, trains, heavy equipment, etc.).
- A commercial or industrial site subject to the storage of wrecked or impounded vehicles.
- Sites with a high likelihood of oil and grease releases (e.g., vehicle repair, vehicle sales, vehicle parts sales, vehicle fueling services).

The requirements of this section do not apply to single-family and duplex residential sites.

Applicants subject to the requirements of this section shall prepare **Form SPC,** located at the end of this chapter. Form SPC shall be included in the submittal package.

Notes:

The traffic threshold focuses on vehicle turnover per square foot of building area (trip generation) rather than ADT alone. This is because oil leakage is greatest when engines are idling or cooling. In general, all-day parking areas are not intended to be captured by these thresholds. The petroleum storage and transfer stipulation is intended to address regular transfer operations such as service stations, not occasional filling of heating oil tanks. Traffic thresholds are researched and compiled by the Institute of Transportation Engineers (ITE).

Parking lots that do not have the above higher-use or higher-risk conditions must use required landscaping within the project area for stormwater (*See Chapter 1.0, Section 1.6.*)

9.8.2 Issue

Stormwater runoff from higher-use or higher-risk sites can contain toxic materials and other organic compounds, oil and grease, heavy metals, nutrients, and suspended solids. Pollutants of concern are primarily generated by vehicle washing and maintenance activities, road oils, and vehicle drips/leaks. These pollutant loads may not be adequately addressed when no water quality facility is required or when volumes exceed the capacity of any required facilities. In such cases, additional pollution reduction facilities or activities may be required. BES will identify additional pollutant prevention or removal needs during SPC application review.

9.8.3 Requirements

1) PAVEMENT

Because of the potential for soil and groundwater contamination, all high-use or high-risk sites shall be paved.

Gasoline and other materials can react with asphalt pavement, causing the release of toxic oils from the pavement. It is therefore preferable to pave the area with Portland cement concrete. If the area is already paved with asphalt, an asphalt sealant shall be applied to the pavement surface. Whichever paving material is used, the paved surface shall be properly maintained to prevent gaps and cracks.

2) DRAINAGE

Drainage from these areas shall be directed to a stormwater disposal system that meets all water quality requirements of this manual and any other applicable codes.

The Oregon Department of Environmental Quality has identified drywells and/or sumps as "Class V Injection Wells" under the federal Underground Injection Control (UIC) Program. Since the UIC Program states that these types of wells have a direct impact on groundwater, stormwater pollution controls will apply. More information about the UIC program can be found on the DEQ web site.

3) OIL CONTROL

City code prohibits the discharge of stormwater with a visible sheen to the City's storm sewer system The following oil control options are designed to capture and detain oil and associated pollutants.

Oil/Water Separators

Oil/water separators rely on passive mechanisms that take advantage of oil being lighter than water. Oil rises to the surface and can be periodically removed. The two types of oil/water separators used for stormwater treatment are the baffle type or API (American Petroleum Institute) oil/water separator and the coalescing plate oil/water separator.

- **Baffle oil/water separators** use vaults that have multiple cells separated by baffles extending down from the top of the vault. The baffles block oil flow out of the vault. Baffles are also commonly installed at the bottom of the vault to trap solids and sludge that accumulate over time. In many situations, simple floating or more sophisticated mechanical oil skimmers are installed to remove the oil once it has separated from the water.

- **Coalescing plate separators** are manufactured units consisting of a baffled vault containing several inclined corrugated plates stacked and bundled together. The plates are equally spaced and are made of a variety of materials, most commonly fiberglass and polypropylene. Efficient separation results because the plates reduce the vertical distance oil droplets must rise in order to separate from the stormwater. Once they reach the plate, oil droplets form a film on the plate surface. The film builds up over time until it becomes thick enough to migrate upward under the influence of gravity along the inclined plate. When the film reaches the edge of the plate, oil is released as large droplets that rise rapidly to the surface, where the oil accumulates until the unit is maintained. Because the plate pack significantly

increases treatment effectiveness, coalescing plate separators can achieve a specified treatment level with a smaller vault size than a simple baffle separator.

Design Criteria and Requirements for Oil/Water Separators when Not Discharged to a Sanitary Sewer: Research has shown that baffle oil/water separators are not as effective for stormwater management as those with coalescing plate separators and cannot be guaranteed to meet the City's prohibited discharge requirements. For this reason, the sizing of oil/water separators with baffles reflects a factor of safety to ensure that they meet the benchmarks. The following design criteria are established to treat the first flush of a storm event, not the complete storm.

- Characteristics of the runoff shall be assumed to be:
  - Specific gravity (SG) of oil is .9
  - Temperature of stormwater runoff is 50°F to 60°F
  - Oil droplet size is 50 microns.

- Baffled separators shall be able to handle a water quality (WQ) design flow equal to two-thirds of a 2- year storm event, in a 24-hour period.

- Coalescing plate separators shall have a WQ design flow equal to one-third of a 2-year storm event, in a 24-hour period.

- Flow calculation shall be based on the impervious area before mitigation has been credited; however, the roof area shall be excluded from the total.

- Oil/water separators shall be installed off-line, bypassing flows greater than the WQ design flow.

- The separator shall precede other water quality treatment facilities when open surface approaches (e.g. swales, infiltration basins) are used. When other types of treatment facilities are used (e.g., manufactured subsurface facilities), the separator may be downstream of those treatment facilities. The separator may be positioned either upstream or downstream of detention facilities, since there are both advantages and disadvantages with either placement.

- If the oil/water separator is discharging to an open-surface water quality facility, the flows shall not exceed three feet per second, per water quality requirements as identified in Chapter 5.0.

- To maintain efficiencies and reduce size, all roof drainage shall enter the stormwater system downstream of the oil/water separator.

- Any pumping devices shall be installed downstream of the separator to prevent oil emulsification in stormwater.

- Engineered calculations shall be required, using the Santa Barbara Unit Hydrograph (SBUH), to verify appropriate sizing of the oil/water separator.

Note: Additional design considerations are required for a baffled oil/water separator is installed. Design requirements are twice the standard water quality requirement for other water quality facilities in this manual, and flow management will need to be engineered. A possible solution may be a flow splitter upstream of the separator and another flow splitter downstream of the separator (but upstream of the water quality facility design).

Design Criteria and Requirements for Oil/Water Separators Discharged to a Sanitary Sewer: Since the discharge limits for the sanitary sewer are not as restrictive as the storm sewers, the design criteria are not as complicated:

- The characteristics of the runoff shall be assumed to be the same as stated above.

- Baffled separators shall retain maximum flows of a system for 45 minutes.

- Coalescing plate separators shall retain maximum flows of a system for 15 minutes.

- Engineered calculations shall be required to verify appropriate sizing of the oil/water separator.

Note: For high-use or high-risk sites located within a larger commercial center, only the impervious surface associated with the high-use or high-risk portion of the site is subject to treatment requirements. If common parking for multiple businesses is provided, treatment shall be applied to the number of parking stalls required for the high-use or high-risk business only. However, if the treatment collection area also receives runoff from other areas, the treatment facility must be sized to treat all water passing through it.

Linear Sand Filters

Linear sand filters have proven effective in meeting standard water quality requirements (*see Chapter 4.0*). Because design criteria are still being established to ensure these facilities can also effectively control oil and grease, their proposed use will require an additional review process for approval. This may delay issuance of related building permits. For more information on the use of linear sand filters to remove oil and grease, contact BES's Industrial Source Control Division at 503-823-7122.

Other Options

There may be other acceptable oil controls not listed above. In many cases landscaping alternatives may be equally or more effective. Applicants may propose an oil control option that would be as effective as those listed. However, proposal of a new oil control will require an additional review process for approval, which may delay issuance of related building permits.

5) ADDITIONAL REQUIREMENTS

Please carefully review the following additional requirements. These requirements are not applicable to all development projects. If they do apply, however, and are not addressed in the project design, revisions will be required. This could delay issuance of related building permits.

Hazardous materials that are toxic, carcinogenic, or halogenated solvents (located in designated groundwater protection areas) are subject to additional requirements, as identified in Section 9.5: Storage, Use, and Transportation of Hazardous/Toxic Materials in Designated Groundwater Resource Protection Areas.

(back to top)

9.9 COVERED VEHICLE PARKING AREAS

9.9.1 Applicability

The requirements in this section apply to all development with a covered vehicle parking area, except single-family and duplex residential sites. Existing parking structures are not required to retrofit unless the structure is being redeveloped. New parking structures are required to meet these requirements.

Applicants subject to these requirements shall prepare **Form SPC** , located at the end of this chapter, fulfills the requirements of Section 9.9.3. Form SPC shall be included in the submittal package.

9.9.2 Issue

Run-off from covered vehicle parking areas can be contaminated with toxic substances, organic compounds, oil and grease, heavy metals, and suspended solids.

COMMENTS ON THE DRAFT STORMWATER MONITORING PROGRAM

John H. Dorsey
City of Los Angeles, Stormwater Management Division
June 18, 2001

These comments focus on Section D (Shoreline Monitoring) of the draft permit issued June 8th, 2001.

Requirements for the shoreline program stated in the draft call for daily monitoring of the Enterococcus bacterial indicator group. This requirement represents an increase in testing frequency of this indicator over its present requirement (5 times/month). We agree with the need for more frequent testing of this indicator group, but we also are striving to keep changes to our monitoring cost neutral. We can achieve this goal by switching to the use of test kits (discussed below) and adjusting the frequency of testing. Also, to provide some flexibility in the 5-year program, we suggest that a provision be made to enable the location of sampling stations to be adjusted if deemed necessary by local public health officials and scientists.

We offer the following recommended changes to the draft based information from regional shoreline monitoring studies coordinated by the Southern California Coastal Water Research Project[1], and discussions with Heal The Bay. They are:

1. **Section D.1.a): Station locations – add a footnote indicating that the station positions could be adjusted during the course of the permit based on recommendations from the Santa Monica Bay Restoration Project and approval from the Executive Officer.**

[1] Noble, Rachel T., J.H. Dorsey, M. Leecaster, V. Orozco-Borbon, D.Reid, K.Schiff, S.B. Weisberg. 2000. A regional survey of the microbiological water quality along the shoreline of the Southern California Bight. *Environmental Monitoring and Assessment* 64: 435-447.

Noble, Rachel T., Dorsey, J., Leecaster, M., Mazur, M., McGee, C., Moore, D., Victoria, O., Reid, D., Schiff, K., Vainik P., Weisberg, S. 2000. Southern California Bight 1998 Regional Monitoring Program, Vol II: Winter shoreline microbiology. Southern California Coastal Water Research Project, Westminster, CA.

Charles D. McGee, Molly K. Leecaster, Patricia M. Vainik, Rachel T. Noble, Kathy O. Walker, and Stephen B. Weisbreg Comparison of Bacterial Indicator Measurements Among Southern California Marine Monitoring . 1997-98 Annual Report. Southern California Coastal Water Research Project, Westminster, CA.

2. **Section D.1.b): Test for three indicator groups (Total coliforms, *E. coli*, and Enterococcus) using either membrane filtration, multiple tube fermentation, or chromogenic substrate test kits. Add a sentence to read "*E. coli* may be substituted for Fecal coliforms if chromogenic substrate test kits are used."**

   We presently test for Total coliforms, Fecal Coliforms and Enterococcus using membrane filtration techniques. By adding some flexibility to testing methods, we can increase our testing frequency for Enterococcus provided we switch to the use of chromogenic substrate test kits like those successfully used during the regional shoreline studies. This switch in methods will also result in testing directly for *E. coli* rather than the more ubiquitous Fecal Coliform group. Unpublished data from Orange County Sanitation District indicate that about 80% of the Fecal Coliform group is represented by *E. coli*, and regional monitoring studies demonstrated that results between the test kits and membrane filtration were comparable.

3. **Section D.1.b): Conduct shoreline testing 6 days/week (Mon-Sat), but include Sunday sampling if a holiday falls on a Monday. In the text-table under "Sample Frequency", insert "6 times/wk (Monday-Saturday)" in lieu of "Daily". Add a footnote to read "Sunday sampling will be conducted in the event that a holiday falls on a Monday."**

   This frequency will provide good coverage, especially for weekend and Monday holidays, while helping to keep the overall program cost neutral for the City.

4. **Section D.1.d): Modify sentence to read "...as recommended by the Santa Monica Bay Restoration Project's Technical Advisory Committee and the Los Angeles County DHS."**

   Stations were shifted in 1994 to their present configuration based on recommendations from a special bacteriological monitoring committee of the SMBRP. Representatives from the County's DHS sat on the committee. Should the need arise to relocate some stations, then such a recommendation should once again be channeled through this body of local experts of which Los Angeles County DHS is a member.

LA MS4 Monitoring Meeting
Tentative Agenda
Pacific Ocean Room
June 25, 2001 at 2:00

Purpose: To discuss questions regarding the June 8 Monitoring Program preliminary draft and to finalize requirements prior to issuance of second draft on June 29.

1. Mass Emission Monitoring
   - Discuss rational for TSS analysis - correlation with storm water pollutants (SCCWRP studies)

2. Toxicity
   - Trigger mechanism - discuss TJs questions
   - Timeframe for useable data - should we start over with regular toxicity monitoring for all stations since previous data is at least 3 years old?
   - Feasibility of TRE - discuss TJs questions

3. Tributary Monitoring
   - Are stations appropriate for model validation?
   - Locations in draft are based on highest load/acre, discuss changing these to locations where stations exist for cost purposes (like county proposal).
   - Discuss analyzing all constituents that the water body is impaired for and pollutants identified as toxic in that watershed (part of TRE) in addition to metals. This is most efficient use of trib sampling.

4. Santa Clara
   - Automatic station installation not very feasible - discuss possibility of manual mass emission sampling at one station in Santa Clara, possibly off of bridge (depending on USGS data and Newhall)
   - Explain rationale for not needing reference station in Santa Clara - TJ
   - Discuss feasibility of trib monitoring for SUSMP comparison, and possibility of accomplishing this as part of the Peak Discharge Impact study.

5. Any other questions and issues the County would like to discuss

Monitoring Program Review

Element	Board Draft	Comments
Mass Emission	1. Monitor mass emissions from the following eight mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and two stations in the Santa Clara River.	1. The County and Regional Board investigated the SC WMA and found that installation of automatic station is not feasible.
	2. Method detection limits (MDLs) A. First storm --> SIP MDLs B. Constituents not detected or detected higher than current MDLs --> current MDLs C. Constituents detected last 2 years (100%) --> current MDLs	
	3. All storms shall be analyzed for Total Suspended Solids. (Metals and PAHs are positively correlated with TSS.)	3. Need to discuss rationale for TSS analysis (SCCWRP studies)
	4. Min. estimated cost (one SIP MDLs/season): $573,000 (6 automatic sta.) + $94,000 (SC grab) + extra sampling labor (SC) + TSS test = $667,000 + α	4. Max. estimated cost: (5 SIP MDLs/season): $889,000 (6 automatic sta.) + $147,000 (SC grab) + extra labor (SC) + TSS test = $1,036,000 + α
Toxicity	1. Water Column Toxicity Monitoring : analyze two wet weather samples and two dry weather samples from each mass emission station for toxicity per year.	
	2. Start over with regular toxicity monitoring for all stations since previous data is at least 3 years old.	2. The County pointed out that some toxicity studies on sea urchins were done for Malibu Ck, Ballona Ck, LA River and SG River in a previous meeting. (Sampling and analyses were conducted over 95/96 to 97/98.)
	3. Test the SC WMA for Ceriodaphnia dubia. 4. Estimated cost: $98,000.	
TIEs	1. Toxicity Identification Evaluations (TIE) : conduct TIEs on wet weather samples when two consecutive samples from the same monitoring station show toxicity and on dry weather samples when two consecutive dry weather samples from the same monitoring station show toxicity. 2. Estimated cost: $33,000.	1. The trigger mechanism for TIEs was determined arbitrarily. Need to find a standard mechanism based on science.
TREs	1. Toxicity Reduction Evaluations (TRE) : perform a TRE for each toxic pollutant. TREs shall include procedures for investigating the causes and identifying corrective actions for toxicity problem.	1. TREs can be another form of TMDLs based on biology.
	2. After the Principle Permittee has isolated the sources of toxicity and identified appropriate BMPs, Each permittee shall be resposible for implementing the appropriate BMPs to reduce toxicity.	2. This process is almost equivalent to source identification, load allocations between cities and BMP implementation of TMDLs. Each permittee should review TREs and think of consequence of implementation of TREs
	3. During TRE development and implementation, continue monitoring the first storm and one dry weather event per year for toxicity at the subject station. Two years after the TRE has been approved, analyze two wet weather and two dry weather samples for toxicity to evaluate the effectiveness of the TRE.	
	4. Maximum contributory amount: $300,000 [toxicity monitoring + TRE development)]	

Tributary	1. Develop and implement a tributary/source identification monitoring program. 2. Min. estimated cost (6 stations, one SIP MDLs/season, all constituents) : $467,000	1. 6 high priority tributary areas were identified as potential sampling locations using the Pollutant Loading model (Tujunga Wash, Compton Ck, Rio Hondo Ch, San Jose Ck, Ballona Ck and Coyote Ck) 2. Max. estimated cost (6 stations, four SIP MDLs/season, all constituents) : $704,000
Trash	1. Develop and implement a trash monitoring program for Los Angeles River and Ballona Creek watersheds. 2. Estimated cost: $10,000,000 ($2,000,000/yr * 5yrs)	1. Trash monitoring should not be a monitoring requirement.
Regional Monitoring	1. Participate on Regional Monitoring Committee (Bight-wide monitoring in 2003). 2. Paticipate on the So. Ca. Stormwater Research/Monitoring Program Committee (Development of an Index of Biological Integrity (IBI)). 3. Estimated Cost: ???	2. The development of an index was bioassessment requirement in the previous draft. The Regional Board shifted it to Regional Monitoring and added a new requirement for bioassessment (see bioassessment below).
Estuary Sampling	1. Sample 25 sites in each estuary/mouth for sediment chemistry, sediment toxicity, and BMI community. 2. Produce a map of each estuary which depicts the impacted areas for sediment monitoring. 3. Estimated Cost: $625,000 (from Megan)	
Bioassessment	1. Identify 20 bioassessment stations and monitor the stations annually, beginning in October 2003. (20 stations and 3 seasons) 2. Estimated cost: $78,000	1. Need to monitor each station twice annually to investigate seasonal patterns. If monitoring twice a year is not possible, monitoring annully in May of each year is more appropriate to detect biological responses to storm water pollution.
Trib SC	1. Monitor trib in the SC WMA to determine impacts of new development and to evaluate effectiveness of SUSMPs. 2. Min estimate cost (2 stations, one SIP MDLs/season, all constituents, all grab) : $156,000	1. The County and Regional Board investigated tributary areas in SC WMA and found that they are not appropriate for the trib monitoring. 2. Max. estimated cost (2 stations, four SIP MDLs/season, all constituents, all grab) : $235,000
Peak Discharge	1. Participate in a study to evaluate peak storm water discharge rate control and to determine numeric criteria to prevent erosion. 2. Maximum contributory amount: $230,000.	
BMP	1. Participate in studies to evaluate the effectiveness of structural and treatment control best management practices. 2. Test the effectiveness of 5 structural BMPs for 5 storm events. (Estimated cost is $87,000, assuming that 2 samples are taken for each structural BMP.) 3. Max. contributary amount : $387,000 (Our own BMP tests + Fund for BMP task force)	1. We participate in BMP Task Force.
Report	1. Estimated cost: $125,000	
Cost	1. Min. total cost: $3,166,000 + $10,000,000 (Trash) + extra labor (SCR) + TSS test + Bight monitoring + Bio index + TREs (?)	1. Max. total cost: $3,851,000 + $10,000,000 (Trash) + extra labor (SCR) + TSS test + Bight monitoring + Bio index + TREs (?)

County's Proposal for Monitoring Program

1. **Monitoring Objectives Identified by the Board**

- Measure and improve the effectiveness of the SQMPs
- Assess the impacts of urban runoff to receiving waters
- Characterize storm water discharges
- Identify sources of pollutants
- Assess the overall health and evaluate long-term trends in receiving water quality

2. **Applications of Monitoring Results**

- Refine the SQMPs to reduce of pollutant loadings
- Protect beneficial uses of receiving waters (designated in the Basin plan)

3. **Goals for Monitoring Requirements of 2001 NPDES Permit (County)**

- Evaluate effectiveness, feasibility, and cost of maintenance of structural and/or non-structural BMPs
- Provide useful information and data for the update of 303(d) list of impaired waters and 305(b) water quality assessment, and development of TMDLs.

4. **Pollutant Loading model → Regional Application**

- Objectives
  a) Identify pollutant sources based on land use information
  b) Prioritize locations that need management actions (BMPs)
  c) Provide information for TMDL development
  d) Generate pollutant loading information
- Model Calibrations and Validations
  a) Determine land use specific runoff coefficients using land use flow data (runoff from homogeneous land use)
  b) Verify runoff coefficients using mass emission flow data (cumulative runoff from large, multiple land use areas)
  c) Obtain water quality data from small areas of uniform hydrologic condition during multiple storms (tributary monitoring)
  d) Investigate impacts of hydrologic parameters (antecedent rainfall, intensity, duration of rainfall, etc.) on event mean concentrations using tributary monitoring data
  e) Compare modeled estimates to observed pollutant loadings at mass emission stations
- Required Monitoring
  a) Mass emission monitoring from 6 stations (3 storm events/year) for model validation → $633,000
  b) Land use monitoring from 8 stations (3 storm events/year) to fill in the gaps in water quality data (bacteria, some metals, pesticides and SVOCs) → $851,000
  c) Tributary monitoring from 3 stations (3 storm events/year) → $264,000
  d) Total monitoring cost: **$1,748,000**

5. **BMP Effectiveness Study**

- We plan to test the effectiveness of 5 structural BMPs for 5 storm events. Two samples need to be taken at upstream and downstream of each BMP.
- We participate in BMP task force.

- Maximum contributory amount: **$500,000** (Our own BMP tests + Fund for BMP task force)

6. **Peak Discharge**
- Participate in a study to evaluate peak storm water discharge rate control and to determine numeric criteria to prevent erosion.
- Maximum contributory amount: **$230,000**.

7. **Toxicity Monitoring**
- Conduct monitoring to complete previous studies
- Estimated cost of Water Column Toxicity Monitoring: **$60,000**.
- Estimated cost of Toxicity Identification Evaluations (TIEs): **$33,000**.

8. **Regional Monitoring**

- Participate in Bightwide03 Regional Monitoring (Sediment task force?).
- Participate in the development of an Index of Biological Integrity (IBI)
- Maximum contributory amount: ???.

9. **Bioassessment**
- Identify **10** bioassessment stations and monitor the stations **twice** annually to investigate seasonal patterns, beginning in 2003. (10 stations and 3 seasons)
- Estimated cost: **$78,000**.

10. **Estuary Sampling**
- Sample 25 sites in each estuary/mouth for sediment chemistry, toxicity, and BMI community.
- Estimated cost: **$625,000**.

11. **Monitoring reports**
- Estimated cost: **$125,000**.

12. **Total cost of the monitoring program: $3,399,000 + Regional Monitoring + Model Validation & Calibration**

E. TOXICITY REQUIREMENTS:

1. ACUTE TOXICITY LIMITATION AND REQUIREMENTS FOR EFFLUENT

a. The acute toxicity of the effluent shall be such that: (i) the average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, and (ii) no single test producing less than 70 % survival.

b. If either of the above requirements I.E.1.a.i. or I.E.1.a.ii. is not met, the Discharger shall conduct six additional tests over a six-week period. The Discharger shall ensure that they receive results of a failing acute toxicity test within 24 hours of the close of the test and the additional tests shall begin within 3 business days of the receipt of the result. If the additional tests indicate compliance with acute toxicity limitation, the Discharger may resume regular testing. However, if the results of any two of the six accelerated tests are less than 90% survival, then the Discharger shall begin a Toxicity Identification Evaluation (TIE). The TIE shall include all reasonable steps to identify the sources of toxicity. Once the sources are identified, the Discharger shall take all reasonable steps to reduce toxicity to meet objective.

c. If the initial test and any of the additional six acute toxicity bioassay tests result in less than 70 % survival the Discharger shall immediately implement the Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan.

d. The Discharger shall conduct acute toxicity monitoring as specified in Monitoring and Reporting Program No. 4245 (Attachment T).

2. CHRONIC TOXICITY REQUIREMENTS FOR EFFLUENT

a. The chronic toxicity of the effluent shall be expressed and reported in toxic units, where:

$$TU_c = \frac{100}{NOEC}$$

The No Observable Effect Concentration (NOEC) is expressed as the maximum percent effluent concentration that causes no observable effect on test organisms, as determined by the results of a critical life stage toxicity test.

b. Chronic toxicity of 100% effluent shall not exceed a monthly median of 1.0 TU_c or a daily maximum of 2.0 TU_c in a critical life stage test.

c. If the chronic toxicity of the effluent exceeds the monthly median of 1.0 TU_c, the Discharger shall immediately implement an accelerated chronic

toxicity testing program according to Monitoring and Reporting Program No. 4245, Item VII.3.b. If any three out of the initial test and the six accelerated tests exceed 1.0 TU_c, the Discharger shall initiate a TIE and implement the Initial Investigation TRE Workplan (see 4., below).

d. The Discharger shall conduct chronic toxicity monitoring as specified in Monitoring and Reporting Program No. 4245 (Attachment T).

3. CHRONIC TOXICITY REQUIREMENTS FOR RECEIVING WATER

a. There shall be no chronic toxicity in ambient waters as a result of wastes discharged.

b. Receiving water and effluent toxicity testing shall be performed on the same day as close to concurrently as possible.

c. If the chronic toxicity in the receiving water downstream at a monitoring station, immediately downstream of the discharge, R4, exceeds 1.0 TU_c in a critical life stage test and the toxicity cannot be attributed to upstream toxicity assessed by the Discharger, then the Discharger shall immediately implement an accelerated chronic toxicity testing according to Monitoring and Reporting Program 4245, Item VII.3.b. If two of the six tests exceed 1.0 TU_c, the Discharger shall initiate a TIE and implement the Initial Investigation TRE Workplan (see 4., below).

d. If the results of the chronic toxicity testing upstream is greater than the results of the testing downstream, and the TU_c of the effluent chronic toxicity test is less than 1 TU_c, then accelerated monitoring does not need to be implemented.

4. PREPARATION OF AN INITIAL INVESTIGATION TRE WORKPLAN

a. The Discharger shall submit a copy of the Discharger's Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan (1-2 pages) to the Executive Officer of the Regional Board for approval within 90 days of the effective date of this permit. If the Regional Board Executive Officer does not disapprove the Workplan within 60 days, the Workplan shall become effective. The Discharger shall use EPA manuals EPA/600/2-88/070 (industrial) or EPA/833B-99/002 (municipal) as guidance. This Workplan shall describe the steps the Discharger intends to follow
if toxicity is detected, and should include, at a minimum:

i. A description of the investigation and evaluation techniques that would be used to identify potential causes and sources of toxicity, effluent variability, and treatment system efficiency;

ii. A description of the facility's methods of maximizing in-house treatment efficiency and good housekeeping practices, and

a list of all chemicals used in operation of the facility; and,

iii. If a toxicity identification evaluation (TIE) is necessary, an indication of the person who would conduct the TIEs (i.e., an in-house expert or an outside contractor) (See MRP Section VII.3.c.iii. for guidance manuals).

VIII. TOXICITY MONITORING REQUIREMENTS

1. ACUTE TOXICITY EFFLUENT MONITORING PROGRAM

a. The Discharger shall conduct acute toxicity tests on 100 % effluent grab samples by methods specified in 40 CFR Part 136 which cites USEPA's *Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms*, August, 1991 (EPA/600/4-90/027) or a more recent edition to ensure compliance.

b. The fathead minnow, *Pimephales promelas*, shall be used as the test species for fresh water discharges and the topsmelt, *Atherinops affinis*, shall be used as the test species for brackish discharges. The method for topsmelt is found in USEPA's *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, First Edition, August 1995 (EPA/600/4-95/136).

c. In lieu of conducting the standard acute toxicity testing with the fathead minnow, the Discharger may elect to report the results or endpoint from the first 48 hours of the chronic toxicity test as the results of the acute toxicity test, but only if the Discharger uses USEPA's August 1993 protocol (EPA/600/4-90/027F) to conduct the chronic toxicity test.

2. CHRONIC TOXICITY EFFLUENT/RECEIVING WATER MONITORING PROGRAM

a. The Discharger shall conduct critical life stage chronic toxicity tests on 24-hour composite 100 % effluent samples or receiving water samples in accordance with EPA's *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms*, Third Edition, July 1994 (EPA/600/4-91/002) or EPA's *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms*, August 1995, (EPA/600/R-95/136).

b. Effluent samples shall be collected after all treatment processes and before discharge to the receiving water. Receiving water samples shall be collected in accordance with the conditions specified in this MRP (Cl-

4245). Receiving water samples shall be collected at mid-depth.

c. Test Species and Methods:

i. Freshwater

1. The Discharger shall conduct short-term tests with the cladoceran, water flea (*Ceriodaphnia dubia* - survival and reproduction test), the fathead minnow (*Pimephales promelas* - larval survival and growth test), and the green alga (*Selenastrum capricornutum* - growth test) as an initial screening process for a minimum of three, but not to exceed five, suites of tests to account for potential variability of the effluent / receiving water. After this screening period, monitoring shall be conducted using the most sensitive species.

2. Re-screening is required every 15 months. The Discharger shall re-screen with the three species listed above and continue to monitor with the most sensitive species. If the first suite of re-screening tests demonstrates that the same species is the most sensitive then the re-screening does not need to include more than one suite of tests. If a different species is the most sensitive or if there is ambiguity, then the Discharger shall proceed with suites of screening tests for a minimum of three, but not to exceed five suites.

3. The presence of chronic toxicity shall be estimated as specified in EPA's *Short-Term Methods for Estimating the Chronic Toxicity of*

Effluents and Receiving Water to Freshwater Organisms, Third Edition, July 1994 (EPA/600/4-91/002).

3. **ADDITIONAL REQUIREMENTS FOR ACUTE AND CHRONIC TOXICITY MONITORING PROGRAMS**

d. Quality Assurance

i. Concurrent testing with a reference toxicant shall be conducted. Reference toxicant tests shall be conducted using the same test conditions as the effluent toxicity tests (e.g., same test duration, etc).

ii. If either the reference toxicant test or effluent test does not meet all test acceptability criteria (TAC) as specified in the test methods manuals (EPA/600/4-91/002 and EPA/600/R-95/136), then the Discharger must re-sample and re-test within 14 days.

iii. Control and dilution water should be receiving water or laboratory water, as appropriate, as described in the manual. If the dilution water used is different from the culture water, a second control using culture water shall be used.

e. Accelerated Monitoring

i. If toxicity is detected as defined in Order No. 01-XXX, Sections I.E.1.a, I.E.2.b., or I.E.3.a., then the Discharger shall conduct six additional tests, approximately every 7 days, over a six-week period. The samples shall be collected and the tests initiated no less than 7 days apart. The Discharger shall ensure that they receive results of a failing acute toxicity test within 24 hours of the completion of the test and the additional tests shall begin within 3 business days of the receipt of the result.

ii. If any three out of the initial test and the six additional tests results exceed 1.0 TU_c, the Discharger shall immediately implement the Initial Investigation of the TRE Workplan.

iii. If implementation of the initial investigation TRE Workplan indicates the source of toxicity (e.g., a temporary plant upset, etc.), then the Discharger shall return to the normal sampling frequency required in Sections IV.C and VI.B. of this MRP.

iv. If toxicity is not detected in any of the six additional tests required above, then the Discharger may return to the normal sampling frequency required in Sections IV.C and VI.B. of this MRP.

v. If a TRE/TIE is initiated prior to completion of the accelerated testing schedule required by Section 3.b.i. of this MRP, then the accelerated testing schedule may be terminated, or used as necessary in performing the TRE/TIE, as determined by the

Executive Officer.

vi. The Discharger shall obtain six (6) consecutive chronic toxicity results less than or equal to 1 TU_c in order to return to the normal sampling frequency required in Sections IV.C and VI.B. of this MRP.

f. Steps in Toxicity Reduction Evaluation (TRE) and Toxicity Identification Evaluation (TIE)

i. Following a TRE trigger, the Discharger shall initiate a TRE in accordance with the facility's initial investigation TRE Workplan. At a minimum, the Discharger shall use EPA manuals EPA/600/2-88/070 (industrial) or EPA/833B-99/002 (municipal) as guidance. The Discharger shall expeditiously develop a more detailed TRE Workplan for submittal to the Executive Officer within 15 days of the trigger, that will include, but not be limited to:

1. Further actions to investigate and identify the cause of toxicity;

2. Actions the Discharger will take to mitigate the impact of the discharge and prevent the recurrence of toxicity;

3. Standards the Discharger will apply to consider the TRE complete and for the return to normal sampling frequency; and,

4. A schedule for these actions.

ii. The following is a stepwise approach in conducting the TRE:

1. Step 1 includes basic data collection. Data collected as part of the accelerated monitoring required may be used to conduct the TRE;

2. Step 2 evaluates optimization of the treatment system operation, facility housekeeping, and the selection and use of in-plant process chemicals;

3. If Steps 1 and 2 are unsuccessful, Step 3 implements a Toxicity Identification Evaluation (TIE) employing all reasonable efforts, and using currently available TIE methodologies. The objective of the TIE is to identify the substance or combination of substances causing the observed toxicity;

4. Assuming successful identification or characterization of the toxicant(s), Step 4 evaluates final effluent treatment options;

5. Step 5 evaluates within plant treatment options; and,

6. Step 6 consists of confirmation once a toxicity control method has been implemented.

   Many recommended TRE elements parallel source control, pollution prevention, and storm water control program best management practices (BMPs). To prevent duplication of efforts, evidence of implementation of these control measures may be sufficient to comply with TRE requirements. By requiring the first steps of a TRE to be accelerated testing, a TRE may be ended in its early stages. All reasonable steps shall be taken to reduce toxicity to the required level. The TRE may be ended at any stage if monitoring finds there is no longer toxicity (or six consecutive chronic toxicity results less than or equal to 1 TU_c).

iii. The Discharger may initiate a TIE as part of the TRE process to identify the cause(s) of toxicity. The Discharger shall use the EPA acute and chronic manuals, EPA/600/6-91/005F (Phase I)/EPA/600/R-96-054 (for marine), EPA/600/R-92/080 (Phase II), and EPA-600/R-92/081 (Phase III) as guidance.

iv. If a TRE/TIE is initiated prior to completion of the accelerated testing schedule required by VI.3.b.i of this MRP, then the accelerated testing schedule may be terminated, or used as necessary in performing the TRE/TIE, as determined by the Executive Officer.

v. Toxicity tests conducted as part of a TRE/TIE may also be used for compliance, if appropriate.

vi. The Board recognizes that toxicity may be episodic and identification of causes of and reduction of sources of toxicity may not be successful in all cases. Consideration of enforcement action by the Board will be based in part on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.

g. Reporting

i. The Discharger shall submit a full report of the toxicity test results, including any accelerated testing conducted during the month as required by Sections I.E.1.a., I.E.2.b., and I.E.3.a. of this MRP. Test results shall be reported in Toxicity Units (percent survival or TU_c) with the discharge monitoring reports (DMR) for the month in which the test is conducted.

   If an initial investigation indicates the source of toxicity and accelerated testing is unnecessary, pursuant to Section VI.3.b.iii.,

then those results also shall be submitted with the DMR for the period in which the Investigation occurred.

ii. The full report shall be submitted by the end of the month in which the DMR is submitted.

iii. The full report shall consist of (1) the results; (2) the dates of sample collection, initiation, and completion of each toxicity test; and (3) the acute toxicity average limit or chronic toxicity limit or trigger as described in Sections I.E.1.a., I.E.2.b., and I.E.3.b. of Order No. 01-XXX.

iv. Test results for toxicity tests also shall be reported according to the appropriate manual chapter on Report Preparation and shall be attached
to the DMR. Routine reporting shall include, at a minimum, as applicable, for each test:

1. sample date(s);
2. test initiation date;
3. test species;
4. end point values for each dilution (e.g. number of young, growth rate, percent survival);
5. NOEC value(s) in percent effluent;
6. IC_{15}, IC_{25}, IC_{40}, and IC_{50} values in percent effluent;
7. TU_c values $\left(TU_c = \frac{100}{NOEC} \right)$;
8. Mean percent mortality (±standard deviation) after 96 hours in 100% effluent (if applicable);
9. NOEC and LOEC values for reference toxicant test(s);
10. IC25 value for reference toxicant test(s);
11. Any applicable control charts; and,
12. Available water quality measurements for each test (e.g., pH, D.O., temperature, conductivity, hardness, salinity, ammonia).

v. The Discharger shall provide a compliance summary which includes a summary table of toxicity data from at least eleven of

the most recent samples.

vi. The Discharger shall notify, by telephone or electronically, this Regional Board of any toxicity exceedance of a limit or trigger within 24 hours of receipt of the results followed by a written report within 14 days of receipt of the result. The verbal or electronic notification shall include the exceedance and the plan the Discharger will pursue. The written report shall describe actions the Discharger has taken or will take to investigate and correct the cause(s) of toxicity. It may also include a status report on any actions required by the permit, with a schedule for actions not yet completed. If no actions have been taken, the reasons shall be given.

Subject: RE: yesterday's meeting

Good morning Megan,
Attached is my proposal. Please keep in mind that we will still do the trib monitoring at 3 sites. If you want more trib monitoring we can change it to 4 sites (+2 mass emissions) as I originally proposed. Only difference is land use monitoring. PAHs and pesticides TMDLs are coming and there is no data available; therefore, the land use monitoring information will be used to provide useful data for TMDL development and source identification in the near future. I believe it has very high priority. Please let me know what Xavier and you think. Thanks!

Subject: yesterday's meeting

Hi TJ,

Do you think you could email me a copy of that handout that you brought yesterday? Not the Monitoring Program Review chart, but the other one with the land use and trib monitoring proposal on it. I think I gave the only copy to Xavier.

Thanks!
Megan

County's Proposal for Monitoring Program

1. **Monitoring Objectives Identified by the Board**

- Measure and improve the effectiveness of the SQMPs
- Assess the impacts of urban runoff to receiving waters
- Characterize storm water discharges
- Identify sources of pollutants
- Assess the overall health and evaluate long-term trends in receiving water quality

2. **Applications of Monitoring Results**

- Refine the SQMPs to reduce of pollutant loadings
- Protect beneficial uses of receiving waters (designated in the Basin plan)

3. **Goals for Monitoring Requirements of 2001 NPDES Permit (County)**

- Evaluate effectiveness, feasibility, and cost of maintenance of structural and/or non-structural BMPs
- Provide useful information and data for the update of 303(d) list of impaired waters and 305(b) water quality assessment, and development of TMDLs.

4. **Pollutant Loading model → Regional Application**

- Objectives
  a) Identify pollutant sources based on land use information
  b) Prioritize locations that need management actions (BMPs)
  c) Provide information for TMDL development
  d) Generate pollutant loading information
- Model Calibrations and Validations
  a) Determine land use specific runoff coefficients using land use flow data (runoff from homogeneous land use)
  b) Verify runoff coefficients using mass emission flow data (cumulative runoff from large, multiple land use areas)
  c) Obtain water quality data from small areas of uniform hydrologic condition during multiple storms (tributary monitoring)
  d) Investigate impacts of hydrologic parameters (antecedent rainfall, intensity, duration of rainfall, etc.) on event mean concentrations using tributary monitoring data
  e) Compare modeled estimates to observed pollutant loadings at mass emission stations
- Required Monitoring
  a) Mass emission monitoring from 6 stations (3 storm events/year) for model validation → $633,000
  b) Land use monitoring from 8 stations (3 storm events/year) to fill in the gaps in water quality data (bacteria, some metals, pesticides and SVOCs) → $851,000
  c) Tributary monitoring from 3 stations (3 storm events/year) → $264,000
  d) Total monitoring cost: **$1,748,000**

5. **BMP Effectiveness Study**

- We plan to test the effectiveness of 5 structural BMPs for 5 storm events. Two samples need to be taken at upstream and downstream of each BMP.
- We participate in BMP task force.

- Maximum contributory amount: **$500,000** (Our own BMP tests + Fund for BMP task force)

6. **Peak Discharge**
- Participate in a study to evaluate peak storm water discharge rate control and to determine numeric criteria to prevent erosion.
- Maximum contributory amount: **$230,000**.

7. **Toxicity Monitoring**
- Conduct monitoring to complete previous studies
- Estimated cost of Water Column Toxicity Monitoring: **$60,000**.
- Estimated cost of Toxicity Identification Evaluations (TIEs): **$33,000**.

8. **Regional Monitoring**

- Participate in Bightwide03 Regional Monitoring (Sediment task force?).
- Participate in the development of an Index of Biological Integrity (IBI)
- Maximum contributory amount: ???.

9. **Bioassessment**
- Identify **10** bioassessment stations and monitor the stations **twice** annually to investigate seasonal patterns, beginning in 2003. (10 stations and 3 seasons)
- Estimated cost: **$78,000**.

10. **Estuary Sampling**
- Sample 25 sites in each estuary/mouth for sediment chemistry, toxicity, and BMI community.
- Estimated cost: **$625,000**.

11. **Monitoring reports**
- Estimated cost: **$125,000**.

12. **Total cost of the monitoring program: $3,399,000 + Regional Monitoring + Model Validation & Calibration**

DATE: June 29, 2001

SUBJECT: **Announcement of a Storm Water Workshop, and Transmittal of the Second Draft – County of Los Angeles Municipal Storm Water NPDES Permit**

ATTACHMENTS: Distribution List
Second Draft – Permit
Second Draft – Staff Report

The Regional Water Quality Control Board (Regional Board) will conduct a workshop before the Board during a public meeting on:

Thursday, July 26, 2001, starting at 9:00 a.m.
at the Metropolitan Water District (MWD) Building, Board Meeting Room
700 North Alameda, Los Angeles

The purpose of the workshop is for Regional Board staff to provide background and a brief overview of a proposed draft permit. A tentative agenda for this workshop will be posted on our web site by July 15, 2001. The public will have opportunity to orally comment on this draft before the Board on July 26, 2001.

By way of background, the County and Cities in Los Angeles County discharge storm water under a municipal storm water permit (Board Order No. 96-054), which expires on July 30, 2001. Following the workshop on July 26, 2001, and after consideration of the public input received, the Regional Board will consider adoption of a renewed permit at a public meeting on October 25, 2001. As part of the renewal process, we are pleased to transmit a second draft of the proposed new permit – the Municipal Storm Water NPDES Permit for the County of Los Angeles and incorporated cities (except for the City of Long Beach, which is covered under a separate permit). We are also enclosing a draft staff report, containing technical justifications for changes from the existing permit. Please submit your comments on this second draft in writing, to this office by August 6, 2001, to the attention of Xavier Swamikannu. Your submittal by this date will provide us sufficient time to evaluate and consider the comments prior to the issuance of the third draft, which we plan to issue by September 6, 2001.

R0002900

Thank you for your attention to renewal of this important permit. We appreciate the comments received to date, and look forward to the publics' oral comments at our workshop on July 26th, and written comments due August 6th. In the meantime, should you have questions regarding specific areas of the second draft, please feel free to contact the appropriate staff person, as listed below.

LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD

ORDER No. 01-XXX
(NPDES No. CAS004001)

WASTE DISCHARGE REQUIREMENTS

FOR

MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES

WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN (EXCEPT FOR THE CITY OF LONG BEACH)

TABLE OF CONTENTS

FINDINGS

Part 6. STANDARD PROVISIONS (continued)

STATE OF CALIFORNIA

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 01-xxx
NPDES PERMIT NO. CAS004001
WASTE DISCHARGE REQUIREMENTS
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES THEREIN, EXCEPT THE CITY OF LONG BEACH

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board) finds:

A. Existing Permit and Report of Waste Discharge

The Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the Los Angeles County Flood Control District (see Attachment A, List of Permittees), hereinafter referred to separately as Permittees and jointly as the Discharger, discharge or contribute to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems. The discharges flow to water courses within the Los Angeles County Flood Control District and into receiving waters of the Los Angeles region. These discharges are covered under countywide waste discharge requirements contained in Order No. 96-054 adopted by this Regional Board on July 15, 1996, and which replaced Order No. 90-079 adopted by this Regional Board on June 18, 1990. Order No. 96-054 also serves as a National Pollutant Discharge Elimination System (NPDES) permit for the discharge of municipal storm water.

B. Nature of Discharges and Sources of Pollutant

1. Storm water discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins that discharge into water bodies of the State. The quality of these discharges varies considerably and is affected by the hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary constituents of concern currently identified by the Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report are cyanide, indicator bacteria, total dissolved solids, turbidity, total suspended solids, nutrients, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), diazinon, and chlorpyrifos.

2. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Permittees have no or limited

jurisdiction over. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine operation, nitrates from atmospheric deposition, heavy metals, lead from fuels, copper from brake pad wear, zinc from tire wear, dioxins as products of combustion, and bis (2-ethylhexyl) phthalate and mercury as resulting from atmospheric deposition, and natural-occurring minerals from local geology. However, the implementation of the measures set forth in this Order are intended to and will contribute to reduced entry of these pollutants into storm water and their discharge to receiving waters.

3. These compounds can have damaging effects on both human health and aquatic ecosystems. In addition, the high volumes of storm water discharged from MS4s in areas of urbanization can significantly impact aquatic ecosystems due to physical modifications such as bank erosion and widening of channels. It is anticipated that, due to the nature of storm water events (i.e., large volumes of water and high velocities) that there may be short-term, reversible impacts to beneficial uses that are not directly related to water quality.

4. Water quality assessments conducted by the Regional Board identified impairment, or threatened impairment, of beneficial uses of water bodies in the Los Angeles Region. The causes of impairments include pollutants of concern identified by the County of Los Angeles in the Integrated Receiving Water Impacts Report (1994-2000).

5. Studies and research conducted by other Regional agencies, academic institutions, and universities have also identified storm water and urban runoff as significant sources of pollutants to surface waters in Southern California., [*Surface Runoff to the Southern California Bight*, Southern California Coastal Water Research Project, (1992); *Impacts of Urban Runoff on Santa Monica Bay and Surrounding Ocean Waters* (Gersberg, R.M., 1995); *State of the Bay 1998*, Santa Monica Bay Restoration Project; *Storm Water Impact*, In, Southern California Environmental Report Card 1999, Institute of the Environment, University of California, Los Angeles (Stenstrom, M.S., 1999); *Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of Southern California Bight,* Shelly L. Moore and M. James Allen (1999); *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999); *Huntington Beach Closure Investigation: Technical Review* (University of Southern California, 2000); *A Regional Survey of the Microbiological Water Quality Along the Shoreline of the Southern California Bight,* Rachel T. Noble et al. (2001).

6. Development and urbanization increase pollutant load, volume, and discharge velocity. First natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants providing an effective natural purification process. In contrast, pavement and concrete can neither absorb water

nor remove pollutants, and thus the natural purification characteristics are lost. Second, urban development creates new pollution sources as the density of human population brings with it proportionately higher levels of vehicle emissions, vehicle maintenance wastes, municipal sewage waste, pesticides, household hazardous wastes, pet wastes, trash, and other anthropogenic pollutants. Development and urbanization especially threaten environmentally sensitive areas. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. In essence, development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. These environmentally sensitive areas include Areas of Special Biological Significance, water bodies designated with a RARE beneficial use, Significant Natural Areas, and Significant Ecological Areas.

7. The increased volume, increased velocity, and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion and impair stream habitat. Studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving waters. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as 10 percent conversion from natural to impervious surfaces. Percentage impervious cover is a reliable indicator and predictor of potential water quality degradation expected from new development. (*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool*, Schueler, T. and R. Claytor, In, Effects of Water Development and Management on Aquatic Ecosystems (1995), ASCE, New York.)

8. The County of Los Angeles has identified as the five highest priority potential priority industrial and commercial critical source types, (I) wholesale trade (scrap recycling, auto dismantling); (ii) automotive repair/ parking; (iii) fabricated metal products; (iv) motor freight; and (v) chemical and allied products (*Critical Source Selection and Monitoring Report*, Los Angeles County Department of Public Works (Sept 1996). Monitoring conducted by Los Angeles County demonstrates that the priority industrial sectors and auto repair facilities (the only commercial sector) on the list, contribute significant concentrations of heavy metals to storm water (*Los Angeles County 1999-2000 Storm Water Monitoring Report*, Los Angeles County Department of Public Works (July 2000)).

9. A review of industrial waste/ pretreatment records performed in 1995 in the County of Los Angeles on illicit discharges indicates that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations. Illicit discharges from automotive service facilities and food service facilities have been identified elsewhere as a major cause of widespread contamination and water quality problems (Washtenaw

County Statutory Drainage Board. 1987. Huron River Pollution Abatement Program)

C. Permit Background

1. The essential components of the Storm Water Management Program, as established by federal regulations [40 CFR 122.26(d)] are: (i) adequate legal authority, (ii) fiscal resources, (iii) SQMP - (Public Information and Participation Program, Industrial/Commercial Facilities Program, Development Planning Program, Development Construction Program, Public Agency Activities Program, Illicit Connection and Illicit Discharges Elimination Program), and (iv) monitoring and reporting program.

2. The Permittees have filed a Report of Waste Discharge (ROWD), dated February 1, 2001, and applied for renewal of their waste discharge requirements and a proposed NPDES permit to discharge wastes to surface waters. The ROWD includes a proposed Storm Water Quality Management Plan (SQMP) and a Monitoring Program. The proposed SQMP contains programs previously approved under Board Order No. 96-054 in the following areas:

   Public Information and Participation
   Development Planning
   Development Construction
   Public Agency Activities
   Illicit Connection/Illicit Discharge Elimination Program

   These programs are revised pursuant to the provisions of this Order after adoption.

3. The County of Los Angeles has previously conducted source identification and pollutant characterization consistent with 40 CFR 122.26(d)(1)(ii) and (iii) under its storm water monitoring program. The Monitoring Program submitted with the ROWD proposes to advance the assessment of receiving water impacts, identification of sources of pollution, evaluation of Best Management Practices (BMPs), and measurement of long term trends in mass emissions.

4. The Regional Board has reviewed the ROWD and has determined it to be complete under the reapplication policy of MS4s issued by the USEPA (61 *Fed. Reg.* 41697). The Regional Board finds that the Permittees' proposed Storm Water Management Plan, incorporating the additional provisions contained in this Order would meet the minimum requirements of federal regulations.

5. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and fast food restaurants), or facilities that perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in storm

water. [References: Pitt *et al.*, *Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260 (1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study*, Western States Petroleum Association and American Petroleum Institute, (1994); *Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices*, Final Report, County of Sacramento (1993).]

6. Retail gasoline outlets are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from retail gasoline outlets have high concentrations of hydrocarbons and heavy metals. [*Schueler and Shepp* (1992)]. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks [*Rouge River National Wet Weather Demonstration Project, Task Product Memorandum – Evaluation of On-line Media Filters RPO-NPS-TPM59.00*, Wayne County, MI, March 1999]. The LA Regional Board and the San Diego Regional Board have jointly prepared a Technical Report on the applicability of new development BMP design criteria for retail gasoline outlets, (*Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts*, (June 2001)). Retail Gasoline Outlets in Western U.S. States (such as Washington and Oregon) are already subject to numerical BMP design criteria under the MS4 program, as well in other U.S. States.

7. The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline-monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline-monitoring requirement be incorporated in this Order. The shoreline pathogen monitoring requirements are outlined in the Monitoring Program for this Order.

D. Permit Coverage

1. The requirements in this Order cover all areas within the boundaries of the Permittee municipalities (see Attachment A) over which they have regulatory jurisdiction as well as unincorporated areas in Los Angeles County Flood Control District within the jurisdiction of the Regional Board. The Permittees serve a population of about 9.5 million [Reference: *2000 Census of Population and Housing*, Bureau of the Census, U.S.

Department of Commerce (2001)] in an area of approximately 3,100 square miles. Attachment B shows the map of the permitted area in Los Angeles County Flood Control District.

2. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the Los Angeles County Flood Control District, and not currently named in this Order, may operate storm drain facilities and/or discharge storm water to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. Consequently, the Regional Board recognizes that the Permittees will not be held responsible for such facilities and/or discharges. The Regional Board will coordinate with these facilities to implement programs that are consistent with the requirements of this Order. Regional Board will consider such facilities for coverage in 2003 under its NPDES permitting scheme pursuant to USEPA Phase II storm water regulations.

3. Sources of discharges into receiving waters in the County of Los Angeles but in jurisdictions outside its boundary include the following:

   About 34 square miles of unincorporated area in Ventura County, which drain into Malibu Creek and thence to Santa Monica Bay,

   About 9 square miles of the City of Thousand Oaks, which also drain into Malibu Creek and thence to Santa Monica Bay, and

   About 86 square miles of area in Orange County, which drain into Coyote Creek and thence into the San Gabriel River.

   The Regional Board will ensure that storm water management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that storm water management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this Order.

4. This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to control the discharge of pollutants in storm water to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the United States.

5. Permittees have expressed their intention to work cooperatively to control the contribution of pollutants from one portion of the MS4 to another portion of the system. Permittees may control the contribution of pollutants to the municipal separate storm sewer system from non-permittee dischargers such as Caltrans, the U.S. Department of Defense, and other state and federal facilities, through interagency agreements.

E. Federal, State, and Regional Regulations

1. The Water Quality Act of 1987 added Section 402(p) to the federal Clean Water Act (CWA) (33 U.S.C Section 1251-1387). This section requires the U.S. Environmental Protection Agency (USEPA) to establish regulations setting forth NPDES requirements for storm water discharges in two phases.

   - The USEPA Phase I storm water regulations were directed at municipal separate storm sewer systems (MS4) serving a population of 100,000 or more, including interconnected systems and storm water discharges associated with industrial activities, including construction activities. The Phase I Final Rule was published on November 16, 1990 (55 *Fed Reg.* 47990).

   - The USEPA Phase II storm water regulations are directed at storm water discharges not covered in Phase I, including small municipal MS4s (serving a population of less than 100,000), small construction projects (one to five acres), municipal facilities with delayed coverage under the Intermodal Surface Transportation Efficiency Act of 1991, and other discharges for which the USEPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. The Phase II Final Rule was published on December 8, 1999 (64 *Fed Reg.* 68722).

2. The USEPA published an 'Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits' on August 26, 1996 (61 Fed. Reg. 43761). This policy discusses the appropriate kinds of water quality based effluent limitations to be included in NPDES storm water permits to provide for the attainment of water quality standards.

3. The USEPA published an 'Interpretative Policy Memorandum on Reapplication Requirements' for MS4 permits on August 9, 1996 (61 *Fed. Reg.* 41697). This policy requires that MS4 reapplication for reissuance for a subsequent five-year permit term contain certain basic information and information for proposed changes and improvements to the storm water management program and monitoring program.

4. The USEPA has entered into a Memorandum of Agreement (MOA) with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service for enhancing coordination regarding the protection of endangered and threatened species under Section 7 of the Endangered Species Act (ESA) and the CWA's Water Quality Standards and NPDES programs. Among other actions, the MOA establishes a framework for coordination of actions by the USEPA, the Services, and CWA delegated States on CWA permit issuance under Section 402 of the CWA [66 Fed. Reg., 11202 – 11217].

5. USEPA regulations at 40 CFR 122.26(d)(2)(iv)(A) and 40 CFR 122.26(d)(2)(iv)(C) require that Permittees implement a program to

monitor and control pollutants in discharges to the municipal system from industrial and commercial facilities that contribute a substantial pollutant load to the MS4. The regulations require that Permittees establish priorities and procedures for inspection of industrial facilities and priority commercial establishments. This permit, consistent with the USEPA policy, incorporates a cooperative partnership, including the specifications of minimum expectations, between the Regional Board and the Permittees for the inspection of industrial facilities and priority commercial establishments to control pollutants in storm water discharges (58 *Fed. Reg.* 61157).

6. Section 402 (p) of the Clean Water Act (33 U.S.C. Section 1342(p) provides that MS4 permits must "require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design engineering method and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." The State Board Office of Chief Counsel has issued a memorandum interpreting the meaning of MEP to include technical feasibility, cost, and benefit derived with the burden being on the municipality to demonstrate compliance (dated February 11, 1999).

7. Section 122.2 of the CWA authorizes the USEPA to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is a delegated State. The Porter-Cologne Water Quality Control Act (California Water Code) authorized the State Water Resources Control Board (State Board), through the Regional Boards, to regulate and control the discharge of pollutants into waters of the State and tributaries thereto. The State Board entered into a Memorandum of Agreement [MOA] with the USEPA, on 22 September 1989, to administer the NPDES Program.

8. Section 303(d) of the CWA requires that the State identify a list of impaired water-bodies and develop and implement Total Maximum Daily Loads (TMDLs) for these waterbodies. A TMDL specifies the maximum amount of a pollutant that a water-body can receive and still protect beneficial uses. The USEPA entered into a consent decree with the Natural Resources Defense Council (NRDC), Heal the Bay, and the Santa Monica BayKeeper on March 22, 1999, under which the Regional Board must adopt all TMDLs for the Los Angeles Region within 13 years from that date. This permit incorporates a provision to implement and enforce approved load allocations for municipal storm water discharges and require changes to the Storm Water Quality Management Plan after pollutants loads have been allocated and approved.

9. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA (16 U.S.C. Sections 1451-1465), amends the Coastal Zone Management Act of 1972, to address five sources of non-point pollution: agriculture, silviculture, urban,

marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The Regional Board addresses septic systems through the administration of other programs.

10. On May 18, 2000, the USEPA established numeric criteria for priority toxic pollutants for the State of California (California Toxics Rule) 65 *Fed. Reg.* 31682, for the protection of human health and aquatic life. These apply as ambient water quality criteria for inland surface waters, and enclosed bays and estuaries. The State Board adopted the, *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California – 2000*) on March 2, 2000, for implementation of the California Toxics Rule (State Board Resolution No. 2000-15 as amended by Board Resolution No. 2000-030). This policy requires that discharges comply with TMDL derived load allocations as soon as possible but no later than 20 years from the effective date of the policy. This Policy also establishes reporting protocols for the results on analytical determinations of chemical constituents and reporting levels (Minimum Level) in wastewater and storm water discharges.

11. The State Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on July 23, 1997. The Ocean Plan contains water quality objectives for the coastal waters of California.

12. The State Board In Re: California Department of Transportation (State Board Order WQ 2001-08), determined that the discharge of storm water to Areas of Special Biological Significance (ASBS) are subject to the prohibition in the Ocean Plan against the discharge of wastes to an ASBS.

13. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, *'Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994).' The Basin Plan, and amendments thereto, which are incorporated in this Order by reference, designates beneficial uses of receiving waters and specifies both narrative and numerical water quality objectives for the receiving waters in Los Angeles County.

14. The Regional Board on April 13, 1998, approved best management practices for sidewalk washing to minimize the discharge of wash waters to the storm drain system (Resolution No. 98-08). By the same Resolution, the Regional Board prohibited the discharge of municipal street wash waters to the storm drain system.

15. The Regional Board on April 13, 1998, approved recommended best management practices for industrial/ commercial facilities (Resolution No. 98-08).

16. The Regional Board on April 22, 1999, approved a list of best management practices for use in development planning and development construction (Resolution No. 99-03)

17. The Regional Board adopted and approved requirements for new development and significant redevelopment projects in Los Angeles County to control the discharge of storm water pollutants in post-construction storm water, on January 26, 2000, in Board Resolution No. R-00-02. The Regional Board Executive Officer issued the approved Standard Urban Storm Water Mitigation Plans (SUSMPs) on March 8, 2000. The State Board in large part affirmed the Regional Board action and SUSMPs in State Board Order No. WQ 2000-11 issued on October 5, 2000.

- The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000,) which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary. Such areas include ministerial projects, projects in environmentally sensitive areas, and water quality design criteria for retail gasoline outlets.

- The State Board's Chief Counsel interprets the Order to encourage regional solutions and endorses a mitigation fund or "bank" that may be funded by developers who obtain waivers from the numerical design standards for new development and significant redevelopment.

18. The Regional Board has determined that the creation of structural or treatment control BMPs for storm water mitigation in waters of the U.S. is not permissible. 40 CFR Part 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any waters of the U.S. Authorizing the construction of a storm water/ urban runoff treatment facility in a jurisdictional water body would tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment and/or mitigation in accordance with SUSMPs and any other requirements of this Order must occur prior to the discharge of storm water into a water of the U.S.

19. The Regional Board supports a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach should be to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It

emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

20. To promote a watershed management approach, the County of Los Angeles is divided into five Watershed Management Areas (WMAs) as follows:

Malibu Creek and Rural Santa Monica Bay WMA
Ballona Creek and Urban Santa Monica Bay WMA
Los Angeles River WMA
San Gabriel River WMA
Dominguez Channel/Los Angeles Harbor WMA
Santa Clara River WMA

Attachment A shows the list of Permittees under each WMA and some Permittees have expressed an intent to form sub-watershed groups within the WMA to promote regional solutions for the mitigation of storm water discharge pollution.

21. To facilitate compliance with federal regulation, the State Board has issued two statewide general NPDES permits: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activity Storm Water Permit (GIASP)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (GCASP)]. The GCASP was reissued on August 19, 1999. The GIASP was reissued on April 17, 1997. Facilities discharging storm water associated with industrial activities and construction projects with a disturbed area of five acres or more are required to obtain individual NPDES permits for storm water discharges, or be covered by these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board. The USEPA guidance anticipates coordination of the state-administered programs for industrial and construction activities with the local agency program to reduce pollutants in storm water discharges to the MS4.

The Regional Board is the enforcing authority in the Los Angeles Region for the two statewide general permits regulating discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites and discharges are also regulated under local laws and regulations.

22. The State Board, on October 28, 1968, adopted Resolution No. 68-16, "Maintaining High Quality Water" which established an anti-degradation policy for State and Regional Boards. This Policy restricts the degradation of surface waters and protects waterbodies where existing water quality is higher than is necessary for the protection of beneficial uses.

23. The State Board, on June 17, 1999, adopted Order No. WQ 99-05, which specifies standard receiving water limitations language to be included in all municipal storm water permits issued by the State and Regional Boards. The receiving water limitations included herein are consistent with the State Board Order, USEPA Policy, and the U.S. Appellate court decision in, *Defenders of Wildlife v. Browner* (9th. Cir, 1999). The State Board Office of Chief Counsel has determined that the federal court decision did not conflict with State Board Order No. WQ 99-05 (memorandum dated October 14, 1999)

24. California Water Code (CWC) Section 13263(a) requires that waste discharge requirements issued by the Regional Board shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; the need to prevent nuisance, and provisions of CWC Section 13241.

25. California Water Code Section 13370 *et seq.* requires that waste discharge requirements issued by the Regional Boards be consistent with provisions of the Federal Clean Water Act and its amendments.

F. Implementation

1. Permittees established an Executive Advisory Committee (EAC) to facilitate permit compliance and enhance consistency in program implementation. The EAC is formally incorporated within this permit as a representative committee of the Permittees.

2. The California Environmental Quality Act (CEQA) (Cal Pub Resources Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve for development. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects, which involve the use of established standards or objective measurements. A ministerial project may be made discretionary by adopting local ordinance provisions that create decision-making discretion . In the alternative, standards and objective criteria may be established administratively for storm water mitigation for ministerial projects. For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements.

3. On March 12, 2001, the United States Court of Appeals ruled that it is necessary to obtain a NPDES permit for application of aquatic pesticides to waterways. (*Headwaters, Inc. vs. Talent Irrigation District, 9th Cir.)* This decision is controlling in California for nonagricultural applications of pesticides to waterways.

4. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this Order requires that the SQMP specify BMPs that will be implemented to control the discharge of pollutants in storm water to the maximum extent practicable. Further, Permittees are to assure that storm water discharges from the MS4 shall neither cause or contribute to the exceedance of water quality standards and objectives nor create conditions of nuisance in the receiving waters, and that the discharge of non-storm water to the MS4 has been effectively prohibited.

5. The SQMP required in this Order builds upon the programs established in Order No. 90-079, and No. 96-054, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SQMP includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various components of the SQMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable. Provisions of the SQMP are fully enforceable under provisions of this Order.

6. The emphasis of the SQMP is pollution prevention through education, public outreach, planning, and implementation as source control BMPs first and then structural and treatment control BMPs next. Successful implementation of the provisions of the SQMP will require cooperation

and coordination of all public agencies in each Permittee's organization, among Permittees, and the regulated community.

7. The implementation of a Public Information and Participation Program is a critical component of a storm water management program. An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

8. This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP or requirement under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

9. This Order contemplates that the Permittees are responsible for considering potential storm water impacts when making planning decisions. This Order or any of its requirements are not intended to restrict or control local land use decision-making authority.

G. Public Process

1. The Regional Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written view and recommendations.

2. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

3. The Regional Board has conducted public workshops to discuss the draft permit.

4. The Los Angeles County Flood Control District, the County of Los Angeles and the other municipalities are Co-permittees as defined in 40 CFR 122.26 (b)(1). Los Angeles County Flood Control District will coordinate with the other municipalities and facilitate program implementation. Each Permittee is only responsible for discharge for which it is the operator.

5. This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit, pursuant to Section 402 of the Federal Clean Water Act, or amendments thereto, and shall take effect 50 days from Order adoption provided the Regional Administrator of the USEPA has no objections.

6. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA (Cal Pub. Resources Code Section 21100 et seq.), in accordance with California Water Code Section 13389.

7. Pursuant to California Water Code Section 13320, any aggrieved party may seek review of this Order by filing a petition with the State Board. A petition must be sent to the State Water Resources Control Board, P.O. Box 100, Sacramento, California, 95812, within 30 days of adoption of the Order by the Regional Board.

8. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the federal NPDES program, and the California Water Code for the issuance of waste discharge requirements.

IT IS HEREBY ORDERED that the Los Angeles County Flood Control District, Los Angeles County, and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

Part 1. DISCHARGE PROHIBITIONS

Each Permittee shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges are:

1. covered by a separate individual or general NPDES permit for non-storm water discharges; or

2. within one of the categories below, and meet all conditions specified by the Regional Board Executive Officer:

   a) Category A - Natural flow:

      (1) Natural springs and rising ground water;

      (2) Flows from riparian habitats or wetlands;

      (3) Stream diversions, permitted by the State Board; and

      (4) Uncontaminated ground water infiltration [as defined by 40 CFR 35.2005(20)].

b) Category B - Flows from emergency fire fighting activity.

c) Category C - Flows incidental to urban activities, all of which are subject to conditions that shall be approved by the Regional Board Executive Officer:

(1) Reclaimed and potable landscape irrigation runoff;

(2) Water line flushing of potable water distribution systems;

(3) Drains for foundations, footings, and crawl spaces;

(4) Air conditioning condensate;

(5) Dechlorinated swimming pool discharges;

(6) Dewatering of lakes and decorative fountains;

(7) Non-commercial car washing by residents or by non-profit organizations; and

(8) Sidewalk rinsing.

The Regional Board Executive Officer may add or remove categories of non-storm water discharges above. Furthermore, in the event that any of the above categories of non-storm water discharges are determined to be a source of pollutants by the Regional Board Executive Officer, the discharge will no longer be exempt from this prohibition unless the Permittee implements conditions approved by the Regional Board Executive Officer to ensure that the discharge is not a source of pollutants. Notwithstanding the above, the Regional Board Executive Officer may impose additional prohibitions of non-storm water discharges in consideration of anti-degradation policies.

Part 2. RECEIVING WATER LIMITATIONS

1. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited.

2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible for, shall not cause or contribute to a condition of nuisance.

3. The Permittee shall comply with Part 2.1. and 2.2. through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SQMP and its components and other requirements of this Order including any modifications. The SQMP and its components shall be designed to achieve compliance with receiving water limitations. If exceedances of water quality objectives or water quality standards (collectively, water quality standards) persist, notwithstanding implementation of the SQMP and its components and other requirements of this permit, the Permittee shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

a) Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, the Permittee shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This report may be incorporated in the annual update of the SQMP and its components unless the Regional Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Board may require modifications to the Report.

b) Submit any modifications to the report required by the Regional Board within 30 days of notification.

c) Within 30 days following the approval of the report, the Permittee shall revise the SQMP and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, implementation schedule, and any additional monitoring required.

d) Implement the revised SQMP and its components and monitoring program according to the approved schedule.

4. So long as the Permittee has complied with the procedures set forth above and is implementing the revised SQMP and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional BMPs.

Part 3. STORM WATER QUALITY MANAGEMENT PLAN (SQMP) IMPLEMENTATION

A. General Requirements

1. Each Permittee shall, at a minimum, implement the SQMP. The SQMP is an enforceable element of this Order.

2. The SQMP shall, at a minimum, comply with the applicable storm water program requirements of 40 CFR 122.26(d)(2). The SQMP and its components shall be implemented so as to reduce the discharges of pollutants in storm water to the maximum extent practicable.

3. Each Permittee may develop a SQMP, incorporating the countywide SQMP, which identifies additional provisions intended to reduce the discharges of pollutants in storm water to the maximum extent practicable.

B. Best Management Practice Implementation

The Permittees shall require implementation of the most effective BMPs for storm water/urban runoff pollution control benefits. When implemented, BMPs shall

result in the reduction of pollutants in storm water to the maximum extent practicable.

C. Modification of the Storm Water Quality Management Plan

The Permittees shall modify the SQMP, at the direction of the Regional Board Executive Officer, to incorporate additional provisions. Such provisions may include regional, watershed specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Daily Maximum Loads (TMDLs) for impaired water bodies.

D. Designation and Responsibilities of the Principal Permittee

The Los Angeles County Flood Control District is hereby designated as the Principal Permittee. As such, The Principal Permittee shall:

1. Coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for ensuring compliance of any individual Permittee.

1. Coordinate permit activities among Permittees and act as liaison between Permittees and the Regional Board on permitting issues.

2. Provide personnel and fiscal resources for compilation, evaluation and submittal of all reports required under this Order and updates of the SQMP and its components;

3. Provide technical and administrative support for committees that will be organized to implement the SQMP and its components;

4. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part F, below, upon designation of representatives;

5. Implement the Countywide Monitoring Program required under this Order and evaluate, assess and synthesize the results of the monitoring program;

6. Provide personnel and fiscal resources for the preparation and submittal to the Regional Board of annual reports and summaries of other reports required under the SQMP; and

7. Comply with the "Responsibilities of the Permittees" in Part 3.E., below.

E. Responsibilities of the Permittees

Each Permittee is required to comply with the requirements of this Order applicable to discharges within its boundaries, and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of the SQMP and any modifications thereto;

2. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of the SQMP applicable to such Permittee in an efficient and cost-effective manner;

3. Designate a technically knowledgeable representative to the appropriate WMC; and

4. Participate in intra-agency coordination (e.g. Fire Department, Building and Safety, Code Enforcement, etc.)necessary to successfully implement the provisions of this Order and SQMP.

5. Prepare an annual summary of expenditures applied to the storm water management program. This summary of budget expenditures shall identify the storm water budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:

    a) Program management

        (1) Administrative costs

        (2) Capital costs

    b) Illicit connection/illicit discharge

    c) Developrnent planning

    d) Development construction

    e) Industrial/Commercial inspection/site visit activities

    f) Construction inspection activities

    g) Public Agency Activities

        (1) Maintenance of structural BMPs and treatment control BMPs

        (2) Municipal Street Sweeping

        (3) Catch basin clean-up

        (4) Trash collection

    h) Public Information and Participation

    i) Monitoring Program

    j) Miscellaneous Expenditures

6. Each Permittee, in addition to the budget summary, shall report any supplemental dedicated budgets, if any, for the same categories.

F. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).

2. The WMC's chair and secretary shall be chosen by the WMC upon Order adoption and on an annual basis, thereafter. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.

3. Each WMC shall:

   a) Facilitate cooperation and exchange of information among Permittees;

   b) Establish additional goals and objectives and associated deadlines for the WMA, as the program implementation progresses;

   c) Prioritize pollution control efforts based on beneficial use impairment(s), watershed characteristics and analysis of results from studies and the monitoring program;

   d) Develop and/or update and monitor the adequate implementation, on an annual basis, of the tasks identified for the WMA;

   e) Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the SQMP and its components;

   f) Continue to prioritize the Industrial/Commercial critical sources for investigation, outreach and follow-up.

   g) Conduct joint WMC meetings four times per year and, as necessary.

G. Executive Advisory Committee (EAC)

1. The EAC shall be composed of one representative from the Malibu Creek WMA, two representatives from each of the other WMAs, one representative from the City of Los Angeles, and one representative from the Los Angeles County Flood Control District.

2. The EAC shall facilitate program compliance in each watershed and enhance consistency among Permittees.

3. The EAC shall conduct its meetings in compliance with the Cal. Gov. Code § 54950 et seq.

H. Legal Authority

1. Permittees shall possess the necessary legal authority to prohibit non-storm water discharges, to the maximum extent practicable, to the storm drain system, including, but not limited to:

a) Prohibit illicit discharges and illicit connections and a requirement for removal of illicit connections;

b) Prohibit the discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other types of automotive service facilities;

c) Prohibit the discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

d) Prohibit the discharge of runoff to the MS4 from areas where repair of machinery and equipment which are visibly leaking oil, fluid or antifreeze, is undertaken;

e) Prohibit the discharge of runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

f) Prohibit the discharge of chlorinated swimming pool water and filter backwash to the MS4;

g) Prohibit the discharge of runoff from the washing of toxic materials from paved or unpaved areas to the MS4;

h) Prohibit washing impervious surfaces in industrial/commercial areas that results in a discharge of runoff to the MS4; and

i) Prohibit the discharge of concrete or concrete laden wash water from concrete trucks, pumps, tools, and equipment to the MS4.

j) Prohibit spills, dumping, or disposal of materials into the MS4, other than storm water, such as:

(1) Litter, landscape debris and construction debris;

(2) Any state or federally banned pesticide, fungicide or herbicide;

(3) Food wastes; and

(4) Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality.

k) Comply with conditions in Permittees ordinances, permits, contracts, model programs, or orders (i.e. hold dischargers to its MS4 accountable for their contributions of pollutants and flows);

l) Utilize enforcement mechanisms to require compliance with Permittees ordinances, permits, contracts, or orders;

m) Control of pollutants (including potential contribution) in discharges of storm water runoff associated with industrial

activities (including construction activities) to its MS4 and control the quality of storm water runoff from industrial sites (including construction sites). This requirement applies to source control, treatment control, and structural control BMPs; and,

n) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4. Permittees must possess authority to enter, sample, inspect, review and copy records, and require regular reports from industrial facilities discharging polluted or potentially polluted storm water runoff into its MS4 (including construction sites).

o) Require the use of best management practices (BMPs) to prevent or reduce the discharge of pollutants to MS4s to the maximum extent practicable.

p) On or before July 1, 2002, if necessary, amend and adopt a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of this permit.

2. The Principal Permittee shall, on or before July 1, 2002, amend the Los Angeles County Public Health Code to require inspections at restaurants that will address:

a) Oil and Grease residue to verify that it is not poured onto a parking lot, street or adjacent catch basin.

b) Dumpster areas to verify that the dumpster area is clean, dumpster lid closed, not filled with liquid or washed out.

c) Parking lot, alley, sidewalk and street areas to verify that floormats, filters and garbage containers are not washed in those areas and that no washwater is poured in those areas.

d) Parking lot area to verify that it is cleaned by sweeping and not by hosing down and that the facility operator uses dry methods for spill cleanup.

3. Each Permittee shall submit no later than July 31, 2002, a statement by the legal counsel that the Permittee has obtained all necessary legal authority to comply with this Order through adoption of ordinances and/or municipal code modifications.

Part 4. SPECIAL PROVISIONS

A. Best Management Practice Substitution

The Regional Board Executive Officer may approve any Best Management Practice (BMP) substitution upon petition by the Permittee(s), if the Permittee can document that:

1. The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of storm water pollutants; or

2. The fiscal burden of the original BMP or program is substantially greater than the proposed alternative and does not achieve a substantially greater improvement in storm water quality; and,

3. The proposed alternative BMP or program will be implemented within a similar period of time.

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall implement a PIPP that incorporates the components of the five-year education plan and the provisions of this section.

Permittees shall work collaboratively to implement a comprehensive education/outreach program with the following objectives:

a) To measurably increase the knowledge of the target audiences regarding the MS4, the impacts of storm water pollution on receiving waters, and potential solutions to mitigate the problems caused;

b) To measurably change the behavior of target audiences by encouraging implementation of appropriate solutions;

c) To involve and engage all socio-economic and ethnic groups in Los Angeles County to participate in mitigating the impacts of storm water pollution.

The Principal Permittee shall submit the PIPP to the Regional Board Executive Officer for review and approval on or before December 31, 2001, and annually thereafter.

1. PIPP - Residential Program

a) The Principal Permittee shall implement the Public Education Program as outlined in the SQMP, including the continuation of the following activities:

Advertising
Media Relations
Public Service Announcements
"How To" Instructional Material Distributed in a Targeted and Activity-Related Manner
Corporate, Community Association, Environmental Organization and Entertainment Industry Tie-Ins
1-888-CLEAN-LA and 888CleanLA.com
Events Targeted to Specific Activities and Population Sub-groups

b) "No Dumping" Message

Each Permittee shall mark all storm drain inlets that they own with a legible "no dumping" message. In addition, signs with prohibitive language discouraging illegal dumping must be posted at designated public access points to creeks, other relevant water bodies, and channels by October 25, 2003. Legible signage and storm drain messages shall be maintained as necessary.

c) Countywide Hotline

The 888-CLEAN-LA hotline will serve as the general public reporting contact for reporting clogged catch basin inlets and illicit discharges/dumping, faded or lack of catch basin stencils, and general storm water management information. Each Permittee may establish its own hotline if preferred. Permittees shall include this information, updated when necessary, in public information, and the government pages of the telephone book, as they are developed/published.

d) Outreach and Education

(1) The Principal Permittee shall implement the second Five-Year Education Plan as detailed in the SQMP.

(2) Each Permittee shall conduct educational activities within its jurisdiction and participate in countywide events.

(3) The Principal Permittee shall organize Public Outreach Strategy meetings with all Permittees on a quarterly basis. The Principal Permittee shall provide guidance for Permittees to augment the countywide outreach and education program. Permittees shall coordinate regional and local outreach and education to reduce duplication of efforts.

(4) The Principal Permittee shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water quality via print, local TV access, local radio, or other appropriate media.

(5) The Principal Permittee in cooperation with the Permittees shall provide all School Districts within its jurisdiction with materials, including videos, live presentations, brochures, and other media necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution. Permittees shall provide the contact information for their appropriate storm water staff to the Principal Permittee on November 25, 2001. Cooperative efforts with other agencies may also be used to accomplish this requirement.

e) Pollutant-Specific Outreach

Permittees shall coordinate to develop outreach programs that target the watershed-specific pollutants listed in Table 1on or before October 25, 2002. Metals may be appropriately addressed through the businesses program. Region-wide pollutants may be included in the Principal Permittee's mass media efforts. Programs shall focus on the anthropogenic sources of each pollutant.

Table 1.	
Watershed	***Target Pollutants for Outreach***
Ballona Creek	Trash, Indicator Bacteria, Metals, PAHs
Malibu Creek	Trash, Nutrients (Nitrogen), Indicator Bacteria, Sediments
Los Angeles River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs
San Gabriel River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals
Santa Clara River	*Reserved*
Dominguez Channel	Trash, Indicator Bacteria, PAHs

Each Permittee shall make outreach materials available to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate public counters and events. Outreach material shall include information on pollutants, sources of concern, and source abatement measures.

2. Businesses Program

a) Corporate Outreach

The Principal Permittee shall develop and implement a Corporate Outreach program to educate and inform corporate environmental management about storm water regulations. The program shall target retail gasoline outlet and restaurant chains. At a minimum, this program shall include:

(1) Conferring with corporate environmental management to explain storm water regulations;

(2) Distribution and discussion of educational material regarding storm water pollution and BMPs, and provide environmental managers with suggestions to facilitate employee compliance with storm water regulations.

Corporate Outreach for all retail gasoline outlet and restaurant chain corporations shall occur once every 2 years, but not less than twice during the permit term.

b) Business Assistance Program

(1) The Principal Permittee and Permittees with the available resources, including but not limited to the City of Los Angeles, may implement a Business Assistance Program to provide confidential, technical resource assistance to small businesses to advise them in BMPs implementation to reduce the discharge of pollutants in storm water runoff. At a minimum, programs may include:

(i) On-site technical assistance or consultation via telephone to identify and implement storm water pollution prevention methods and best management practices; and

(ii) Availability, distribution, and discussion of applicable BMP and educational materials.

C. Industrial/Commercial Facilities Program

Each Permittee shall implement an Industrial and Commercial Program with the objective of controlling and reducing pollutants in storm water runoff from Phase I, Automotive, RGOs and Restaurants to the maximum extent practicable. At a minimum, the Program shall include the following requirements:

1. Restaurants

The Principal Permittee shall inspect all restaurants to determine that each restaurant is effectively implementing storm water BMPs.

a) Frequency: The Principal Permittee shall inspect each restaurant once every 24 months.

b) Level of inspection: The Principal Permittee shall confirm that BMPs are effectively implemented in accordance with County ordinances, Regional Board Resolution 98-08, and the SQMP.

2. Retail Gasoline Outlets

The Principal Permittee shall communicate appropriate BMPs to each RGO to help ensure that RGOs are effectively implementing BMPs in accordance with the SQMP and Regional Board Resolution 98-08.

3. Automotive Service Facilities

Each Permittee shall inspect all Automotive Service Facilities within its jurisdiction, to confirm that such facilities are effectively implementing storm water BMPs.

a) Frequency: Each automotive service facility shall be inspected once every 24 months. If an inspection shows non-compliance with the SQMP and local storm water ordinances (including failure

to implement pollution prevention BMPs), the facility shall be re-inspected within 90 days.

b) Level of inspection: The Permittees shall determine that BMPs are effectively implemented, in accordance with the SQMP, Regional Board Resolution 98-08, and storm water ordinances. As necessary, Permittees shall advise owners/operators of Automotive Service Facilities to implement additional BMPs, necessary to reduce the discharge of pollutants in storm water to the maximum extent practicable.

4. **USEPA Phase I Facilities**

a) Database for Source Identification: Each Permittee shall annually update a watershed-based inventory of all USEPA Phase I facilities, Retail Gasoline Outlets, Automotive Service Facilities, and Restaurants within its jurisdiction, regardless of whether or not the facility is subject to the GIASP or other individual or general NPDES permits. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or web-based system is highly recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc.).

b) Site Visits to USEPA Phase 1 Facilities: Based on the inventory developed under 4.a) above, each Permittee shall visit facilities that appear to be subject to requirements of USEPA Phase I storm water regulations, as specified below.

(1) Frequency: Each Permittee shall visit all facilities within 24 months from the Order adoption date.

(2) Level of visit: Each Permittee shall confirm that each owner/operator: (a) filed a Notice of Intent, and that a Storm Water Pollution Prevention Plan is available on-site, and (b) is in compliance with model programs for industrial and commercial facilities, with Permittees' storm water ordinances, and with Regional Board Resolution 98-08.

(3) Enforcement Referral: For any facility not enrolled under the GIASP (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its requirement to enroll in the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board a copy of their records to identify non-filers.

c) Each Permittee shall develop a program to conduct spot checks of USEPA Phase I facilities, excluding those previously determined to pose no risk of exposure, in each year subsequent to the completion of the first inventory of USEPA Phase I facilities (i.e., first 24 months), but not less than 20% of the total number in each year. Facilities determined at no risk of exposure will be so identified in the inventory database.

d) In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other equivalent BMPs. Furthermore, Permittees may require additional site-specific BMPs as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP. For industrial and specified commercial sites tributary to Clean Water Act section 303(d) impaired water bodies (where a site discharges pollutants for which the water body is impaired), Permittees may require implementation of additional controls as necessary to comply with this Order. For industrial and specified commercial sites within or directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas, Permittees may require implementation of additional controls as necessary to comply with this Order.

e) Nothing in this section precludes Permittees from performing additional activities to control storm water runoff from industrial and commercial facilities to their MS4, as they deem necessary, or through an already existing program. Also, nothing in this section precludes Permittees from enforcing their own municipal ordinances as they pertain to discharges of storm water runoff from industrial and commercial sites within their jurisdiction.

5. Interagency Coordination

In response to any complaint related to storm water or non-storm water discharges or a specific request by the Regional Board, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water ordinances. In addition, Permittees

shall provide compliance assistance to the Regional Board through various supporting activities, including but not limited to: referrals of complaints, assisting in searches for current owners, operators, and leasees in conjunction with activities performed at any facility within its jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Copies of the inspection/site visit report and any follow-up documentation performed as required in this section shall be provided to the Regional Board Executive Officer upon request.

D. Development Planning Program

1. The Permittees shall implement a development-planning program that will require all planning priority development and redevelopment projects to:

   a) Minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances and other legal authorities;

   b) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground;

   c) Minimize the quantity of storm water directed to impermeable surfaces and the MS4;

   d) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices;

   e) Provide for appropriate permanent measures to reduce storm water pollutant loads in storm water from the development site.

2. Peak Flow Control

   The Permittees shall develop and implement numerical criteria on or before October 31, 2002, to control the post-development peak storm runoff discharge rates in natural drainage systems to maintain or reduce pre-development peak discharge rates to prevent down-stream erosion, and to protect stream habitat. Natural drainage systems include the following:

   a) Malibu Creek

   b) Topanga Canyon Creek

   c) Upper Los Angeles River

   d) Upper San Gabriel River

   e) Santa Clara River

f) Named and unnamed coastal drainages

3. Standard Urban Storm Water Mitigation Plans

a) Each Permittee shall require that single-family hillside home developments:

(1) Conserve natural areas

(2) Protect slopes and channels

(3) Provide storm drain system stenciling and signage

(4) Divert roof runoff to vegetated areas before discharge

(5) Direct surface flow to vegetated areas before discharge

b) Each Permittee shall require that a Standard Urban Storm Water Mitigation Plan as approved by the Regional Board in Board Resolution No. R 00-02 be implemented for the following categories of developments with immediate effect:

(1) Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

(2) A 100,000 or more square feet industrial/ commercial development

(3) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

(4) Retail gasoline outlets

(5) Restaurants (SIC 5812)

(6) Parking lots 5,000 square feet or more or with 25 or more parking spaces

c) The Permittees shall require the implementation of SUSMPs provisions for all projects located in or directly adjacent to or discharging directly to an environmentally sensitive area, where, the development will:

(1) create 2,500 square feet or more of impervious area, or

(2) alter the area of imperviousness of the site to ten or more percent of the naturally occurring condition, and

(3) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat

4. Numerical Design Criteria

The Permittees shall require that post-construction treatment control BMPs incorporate, at a minimum, the following design criteria to mitigate (infiltrate, filter or treat) storm water runoff:

a) Volumetric Structural or Treatment Control BMP

(1) the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

(2) the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

(3) the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

(4) the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

and/or

b) Flow Based Structural or Treatment Control BMP

(1) the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity, or

(2) the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County

(3) the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above,

5. Applicability of Numerical Design Criteria

The Permittees shall require the following categories of planning priority projects to design and implement post-construction treatment and structural controls to mitigate storm water pollution:

a) Single-family hillside residential developments of one acre or more

b) Housing developments (includes single family homes, multifamily homes, condominiums, and apartments) of one acre or more.

c) A 100,000 square feet or more industrial/ commercial development

d) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534 and 7536-7539) [5,000 square feet or more]

e) Retail gasoline outlets [5,000 square feet or more and with projected Average Daily Traffic (ADT) of 100 or more vehicles]

f) Restaurants (SIC 5812) [5,000 square feet or more]

g) Parking lots 5,000 square feet or more or with 25 or more parking spaces

h) Projects located in, adjacent to or discharging directly to environmentally sensitive areas that meet threshold conditions identified above in 3.c.

6. Not later than March 9, 2003, each Permittee shall require the implementation of SUSMP and post-construction control requirements for the industrial/commercial category to projects one acre and greater to conform to USEPA Phase II storm water regulations.

7. Site Specific Mitigation

a) Each Permittee shall require the implementation of a site-specific plan to mitigate post-development storm water for developments not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where the following project characteristics exist:

(1) Vehicle or equipment fueling areas;

(2) Vehicle or equipment maintenance areas, including washing and repair

(3) Commercial or industrial waste handling or storage

(4) Outdoor handling or storage of hazardous materials;

(5) Outdoor manufacturing areas

(6) Outdoor food handling or processing

(7) Outdoor animal care, confinement, or slaughter

(8) Outdoor horticulture activities

8. Redevelopment Projects

The Permittees shall apply the SUSMP, or site specific requirements including post-construction storm water mitigation to all planning priority projects that undergo significant redevelopment in their respective categories. Significant redevelopment means land-disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Where

significant redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated.

9. Maintenance Agreement and Transfer

Each Permittee shall require that all developments subject to SUSMP and site specific plan requirements provide verification of maintenance provisions for structural and treatment control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and or conditional use permits. Verification at a minimum shall include:

a) The developers signed statement accepting responsibility for maintenance until the responsibility is legally transferred, and either

b) A signed statement from the public entity assuming responsibility for structural or treatment control BMP maintenance and that it meets all local agency design standards, or

c) Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year, or

d) Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the structural and treatment control BMPs; or

e) Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction structural or treatment control BMPs

10. Regional Storm Water Mitigation Program

A Permittee or Permittee group may apply to the Regional Board for approval of a regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development. Upon review and a determination by the Regional Board Executive Officer that the proposal is technically valid and appropriate, the Regional Board may consider for approval such a program if its implementation will result in equivalent or improved storm water quality and protect stream habitat.

11. Mitigation Funding

The Permittees may propose a management framework, for endorsement by the Regional Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where the following situations occur:

a) A waiver for impracticability is granted

b) Legislative funds become available

c) Off-site mitigation is required because of loss of environmental habitat

d) An approved watershed management plan exists that incorporates an equivalent or improved strategy for storm water mitigation for new development

12. California Environmental Quality Act (CEQA) Document Update

Each Permittee shall modify planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation, with immediate effect. The CEQA guidelines shall require consideration of the following:

a) Potential Impact of project construction on storm water runoff

b) Potential Impact of projects post-construction activity on storm water runoff.

c) Potential for discharge of storm water from areas from material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas.

d) Potential for discharge of storm water to impair the beneficial uses of the receiving waters or areas that provide water quality benefit

e) Potential for the discharge of storm water to cause significant harm on the biological integrity of the waterways and water bodies

f) Potential for significant changes in the flow velocity or volume of storm water runoff that can cause environmental harm

g) Potential for significant increases in erosion of the project site or surrounding areas

13. General Plan Update

a) Each Permittee shall amend, revise or update its General Plans to include watershed and storm water quality and quantity management considerations and policies when the following General Plans elements are updated or amended: (i) Land Use, (ii) Housing, (iii) Conservation, (iv) Open Space.

b) Each Permittee shall provide the Regional Board with the draft amendment or revision when a listed General Plan element or the

General Plan is noticed for comment in accordance with Govt. Code § 65350 et seq.

14. Targeted Employee Training

Each Permittee shall train its employees in targeted positions (whose jobs or activities are engaged in development planning) regarding the requirements of the development planning on an annual basis beginning no later than March 31, 2002, and more frequently if necessary.

15. Developer Technical Guidance and Information

a) Each Permittee shall develop and make available to developer development planning guidelines immediately.

b) The Principal Permittee in partnership with Permittees shall issue no later than March 31, 2003, a technical manual for the siting and design of BMPs for the development community in Los Angeles County. The technical manual may be adapted from the revised California Storm Water Quality Task Force Best Management Practices Handbooks scheduled for publication in September 2002. The technical manual shall at a minimum include:

(1) Specifications for treatment control BMPs based on flow-based and volumetric water quality design criteria for the purposes of countywide consistency,

(2) Criteria for control of peak discharge rates, velocities and duration,

(3) Expected pollutant removal performance ranges

(4) Maintenance considerations

(5) Cost considerations

E. Development Construction Program

Each Permittee shall implement a program to control runoff from construction activity at all construction sites within its jurisdiction. The program shall ensure the following minimum requirements are effectively implemented at all construction sites:

a) Sediments shall not be discharged to the MS4 or receiving waters. Sediments generated on the project site shall be retained using adequate structural drainage controls;

b) No construction-related materials, wastes, spills, or residues shall be discharged from the project site to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff;

c) Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at the project site; and

d) Erosion from slopes and channels will be prevented by implementing BMPs including, but not limited to: limiting of grading scheduled during the wet season; inspecting graded areas during rain events; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes; and

e) Discourage grading during the wet season. Proper justification for the need to grade during the wet season shall be provided to the Permittee. All erosion susceptible slopes shall be covered, netted, planted, or protected in any way that prevents sediment discharge from the site.

1. In addition, for construction sites one acre and greater, each Permittee shall require compliance with all conditions in section E. above and:

a) Shall require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP), prior to issuance of a grading permit for construction projects, that meets one or more of the following criteria:

(1) Will result in soil disturbance of one acre or more in size;

(2) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area; or

(3) Is located in a hillside area.

The Local SWPPP shall include appropriate construction site BMPs and maintenance schedules. (A State required SWPPP may be substituted by a Local SWPPP if the Local SWPPP is at least as inclusive as the requirements for a State SWPPP). The Local SWPPP must include the rationale used for selecting or rejecting BMPs. The project architect, or engineer of record, or authorized qualified designee, must sign a statement on the Local SWPPP to the effect:

"As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activity."

The landowner shall sign a statement to the effect:

"I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for

gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/or inaccurate information, failing to update the Local SWPPP to reflect current conditions, or failing to properly and/or adequately implement the Local SWPPP may result in revocation of grading and/or other permits or other sanctions provided by law."

The Local SWPPP certification shall be signed by the landowner as follows, for a corporation: by a responsible corporate officer which means (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures; for a partnership or sole proprietorship: by a general partner or the proprietor; or for a municipality or other public agency: by an elected official, a ranking management official (e.g., County Administrative Officer, City Manager, Director of Public Works, City Engineer, District Manager), or the manager of the construction activity if authority to sign Local SWPPPs has been assigned or delegated to the manager in accordance with established agency policy.

b) Shall inspect all construction sites with Local SWPPPs for storm water quality requirements during routine inspections a minimum of once during the wet season. The Local SWPPP shall be reviewed for compliance with local codes, ordinances, and permits. For inspected sites that have not adequately implemented their Local SWPPP, a follow-up inspection to ensure compliance will take place within 2 weeks. If compliance has not been attained, the Permittee will take additional actions to achieve compliance (as specified in municipal codes). If compliance has not been achieved, and the site is covered under the State General Construction Activity Storm Water Permit, each Permittee shall enforce their local ordinance requirements, and if non-compliance continues the Regional Board shall be notified for further joint enforcement actions.

c) Commencing March 10, 2003, shall require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of filing a Notice of Intent (NOI) for coverage under the State General Construction Activity Storm Water Permit and a certification that a SWPPP has been prepared by the project developer. The prepared SWPPP may satisfy the requirement under E.1. (in-lieu of Local SWPPP).

2. In addition, for sites five acres and greater, each Permittee shall:

a) Require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of filing a Notice of Intent (NOI) for coverage under the State General Construction Activity Storm Water Permit and a certification that a SWPPP has been prepared by the project developer. The prepared SWPPP may satisfy the requirement under E.1. (in-lieu of Local SWPPP).

b) Each Permittee shall require proof of an NOI and a copy of the SWPPP at any time a transfer of ownership takes place for the entire development or portions of the common plan of development where construction activities are still on-going.

c) Each Permittee shall use an effective system to track grading permits issued by each Permittee. A database or GIS system is encouraged, but not required, to be used to satisfy this requirement.

3. Each Permittee shall train employees in targeted positions (whose jobs or activities are engaged in construction activities including construction inspection staff) regarding the requirements of the storm water management program no later than March 31, 2002, and annually thereafter. A list of trained employees shall be maintained by each Permittee.

F. Public Agency Activities Program

1. Each Permittee shall implement a Public Agency program to minimize storm water pollution impacts from public agency activities. Public Agency requirements consist of:

Sewage Systems Operations
Public Construction Activities
Vehicle Maintenance/Material Storage Facilities Management
Landscape and Recreational Facilities Management
Storm Drain Operation and Management
Streets and Roads Maintenance
Parking Facilities Management
Public Industrial Activities
Emergency Procedures
Dry Weather Diversions

2. Each Permittee shall conduct an assessment of measures that can be implemented to reduce and/or prevent trash from entering the MS4 system. The Assessment and a schedule for implementation shall be submitted to the Regional Board Executive Officer for review by July 1, 2003.

3. Sewage System Operations

Each Permittee shall implement a response plan for overflows of the sanitary sewer system within their respective jurisdictions which shall consist at a minimum of the following:

a) Investigation of any complaints received;

b) Immediate response to overflows by containment; and

c) Notification to appropriate sewer and public health agencies when a sewer overflows to the MS4.

In addition to 3.a, 3.b, and 3.c above, for those Permittees which own and/or operate a sanitary sewer system, each Permittee shall also implement the following requirements (until such time that the proposed Capacity, Management, Operation and Maintenance Regulations (CMOM) are promulgated by the USEPA. After which, the CMOM regulations shall be enforceable under this Order until such time they are added into an individual NPDES permit):

d) A program to prevent sewage spills or leaks from sewage facilities from entering the MS4; and

e) Identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4.

4. Public Construction Activities Management

a) Each Permittee shall implement a program to control runoff from construction activity at all construction sites. To accomplish this, the Permittees shall revise their Development Construction Program in the SQMP no later than March 31, 2002. The revisions shall specify a schedule for implementation by each Permittee, and must contain the following minimum elements, including performance measures, schedules for implementation, and shall include the following categories of construction:

(1) Less than one acre;

(2) Between one and five acres; and

(3) Five or more acres.

b) Each Permittee shall comply with requirements in section E. and with the following conditions, at all public construction sites:

(1) Design and construction of public facilities shall be consistent with the requirements and dates specified for private development in Part 4.D.;

(2) Prepare and retain site-specific SWPPPs for municipal construction sites;

(3) Implement construction and post-construction storm water controls as required of private construction projects, including numerical mitigation criteria for post-construction BMPs;

(4) Implement a program to ensure that SWPPPs and BMPs implemented are effective;

(5) Inspect public construction sites and implement changes as necessary to maintain or replace ineffective BMPs in order to protect water quality; and

(6) Each Permittee shall obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites 5 acres or greater (or part of a larger area of development, etc...) except that a municipality under 100,000 in population need not obtain coverage under a separate permit until March 10, 2003.

c) No later than March 9, 2003, each Permittee shall obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater.

5. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Each Permittee shall implement pollution prevention plans for public vehicle maintenance facilities and material storage facilities which have the potential to discharge pollutants into storm water.

b) Each Permittee shall implement BMPs to minimize pollutant discharges in storm water including but not be limited to:

(1) Good housekeeping practices;

(2) Material storage control;

(3) Vehicle leaks and spill control; and

(4) Illicit discharge control;

c) Each Permittee shall require that all vehicle/equipment wash areas be self-contained or covered, or equipped with a clarifier, or other pretreatment device, and properly connected to the sanitary sewer to prevent the discharge of pollutants to the MS4 for new facilities or during redevelopment of existing sites.

6. Landscape and Recreational Facilities Management

Each Permittee shall implement the following requirements:

a) A standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers;

b) Ensure no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied;

c) Ensure that no banned pesticides, herbicides, fungicides, or rodenticides are stored or applied;

d) Ensure that staff applying pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator;

e) Implement procedures to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs;

f) Store fertilizers and pesticides indoors or under cover on paved surfaces or use secondary containment;

g) Reduce the use, storage, and handling of hazardous materials to reduce the potential for spills; and

h) Regularly inspect storage areas.

7. Storm Drain Operation and Management

Each Permittee shall:

a) designate catch basin inlets within its jurisdiction as one of the following:

Priority A – catch basins that are designated as consistently generating the highest volumes and trash and/or litter.

Priority B - catch basins that are designated as consistently generating moderate volumes and trash and/or litter

Priority C – catch basins that are designated as generating low volumes of trash and/or litter.

b) Clean catch basins according to the following schedule:

Priority A –at least once per month during the wet season.

Priority B - Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 40% full during the wet season. From July 1, 2003 to the date this Order is renewed, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 25% full during the wet season.

Priority C – as necessary but at least once per year.

c) For any special event that can be reasonably expected to generate quantities of trash and litter, the Permittee shall, as a condition of the special use permit issued for that event, include provisions that provide for the proper management of trash and litter generated from the event. At a minimum, the Permittee shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain.

d) For each Permittee subject to a trash TMDL, the Permittee may implement a program which maximizes trash removal by using an effective combination of street sweeping, catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve waste load allocations).

e) Each Permittee shall:

(1) Keep record of catch basins cleaned;

(2) Record the quantity of catch basin waste collected [The data shall be reported in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g., compacted volume based on a standardized compaction rate, dry weight, etc.). The Permittees may select the unit, but all Permittees shall use the same unit of measure.];

(3) Inspect the legibility of the catch basin stencil or label nearest the inlet. Illegible stencils shall be recorded and re-stenciled or re-labeled within 180 days of inspection; and

(4) Submit a record (preferably but not required, as a GIS layer) of all catch basins in a municipality and identify which are city-owned/county-owned, and which to note priority for more frequent cleaning.

f) Each Permittee shall implement BMPs for Storm Drain Maintenance that shall include:

(1) A program to visually monitor open channel storm drains for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection;

(2) A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality;

(3) Removal of trash and debris from open channel storm drains shall occur a minimum of once per year before the storm season;

(4) Minimize the discharge of contaminants during MS4 maintenance and clean outs;

(5) Record the quantity of open channel waste collected by stream or channel segment [The data shall be reported in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g., compacted volume based on a standardized compaction rate, dry weight, etc.). The Permittees may select the unit, but all Permittees shall use the same unit of measure.]; and

(6) Proper disposal of material removed.

8. Streets and Roads Maintenance

a) Each Permittee shall designate streets and/or street segments within its jurisdiction as one of the following:

Priority A – streets and/or street segments that are designated as consistently generating the highest volumes and trash and/or litter.

Priority B - streets and/or street segments that are designated as consistently generating moderate volumes and trash and/or litter.

Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter.

b) Each Permittee shall perform street cleaning according to the following schedule:

Priority A – These streets and/or street segments shall be swept at least two times per month.

Priority B - Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month.

Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year.

c) Each Permittee shall require that sawcutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain.

d) Concrete and other street and road maintenance materials and wastes shall be managed to prevent pollutant discharges; and

e) The washout of concrete trucks and chutes shall only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system.

f) Each Permittee shall implement a program which maximizes trash removal by using an effective combination of street sweeping,

catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve TMDL waste load allocations.

g) Each Permittee shall train their employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

(1) Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

(2) Identify and select appropriate BMPs.

9. Parking Facilities Management

Permittee-owned parking lots shall be kept clear of debris and oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. In no case shall a Permittee-owned parking lot be cleaned less than once a month.

10. Public Industrial Activities

Each Permittee shall, for any municipal activity considered an industrial activity covered under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than November 25, 2001, except that a municipality under 100,000 in population need not file the NOI until March 10, 2003.

11. Emergency Procedures

Each Permittee shall continue to repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as: earthquakes; fires; floods; landslides; or windstorms. BMPs shall be implemented to the extent that measures do not compromise public health and safety. After initial emergency response or emergency repair activities have been completed, each Permittee shall implement BMPs as required under this Order.

12. Dry Weather Diversions

a) Each Permittee shall prioritize drains for possible diversion of dry weather flows from areas within their jurisdiction that flow to areas where the public may be impacted (for public health and safety and/or environmental reasons). The Permittees shall collectively review their individual prioritized lists and create a watershed based priority list of possible drains for diversion no later than March 31, 2002 and submit a listing of priority diversions to the Regional Board Executive Officer. The Permittees shall immediately begin a feasibility study and discussions with the appropriate sewer agency for diversion of selected dry weather

flows to the sanitary sewer for treatment, subject to approvals of the Regional Board and the appropriate sewer agency.

b) The Permittees shall investigate and determine the location of potential dry weather urban runoff treatment devices for strategic placements in areas of the watersheds where most appropriate. This information shall be submitted to the Regional Board Executive Officer no later than March 31, 2002.

G. Illicit Connections and Illicit Discharges Elimination Program

Permittees shall eliminate all illicit connections and illicit discharges to the storm drain system, and shall document, track, and report all such cases in accordance with the elements and performance measures specified in the following subsections.

1. General

a) Implementation: Each Permittee must develop an Implementation Program which specifies how each Permittee is implementing revisions to the IC/ID Program. This Implementation Program must be documented, and available for review and approval by the Regional Board Executive Officer, upon request.

b) Tracking: All Permittees shall develop and maintain a baseline map of their storm drain system, showing all storm drain connections permitted by the Permittee, at a scale and in a format specified by the Lead Permittee. On an annual basis, all Permittees shall map all illicit connections and discharges on their baseline maps, and shall transmit this information to, and in a format specified by, the Principal Permittee. No later than October 25, 2002, the Principal Permittee shall use this information as well as results of baseline and priority screening for illicit connections (as set forth in subsection 2 below) to start an annual evaluation of patterns and trends of illicit connections and illicit discharges, with the objectives of identifying priority areas for elimination of illicit connections and illicit discharges, and making recommendations for corrective action.

c) Training: All Permittees shall train all targeted employees who are responsible for identification, investigation, termination, cleanup, and reporting of illicit connections and discharges. For Permittees with a population of less than 250,000, training shall be completed no later than March 31, 2002. For Permittees with a population of 250,000 or more, training shall be completed no later than October 25, 2002. Furthermore, all Permittees shall conduct refresher training on an annual basis thereafter.

d) Documentation and Reporting: Document and report all illicit connections, illicit discharges, and hazardous substances that

"Anti-degradation policies" means the *Statement of Policy with Respect to Maintaining High Quality Water in California* (State Board Resolution No. 68-16) which protects surface and ground waters from degradation. In particular, this policy protects waterbodies where existing quality is higher than that necessary for the protection of beneficial uses including the protection of fish and wildlife propagation and recreation on and in the water.

"Applicable Standards and Limitations" means all State, interstate, and federal standards and limitations to which a "discharge" or a related activity is subject under the CWA, including "effluent limitations, "water quality standards, standards of performance, toxic effluent standards or prohibitions, "best management practices," and pretreatment standards under sections 301, 302, 303, 304, 306, 307, 308, 403 and 404 of CWA.

"Authorized Discharge" means any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

"Automotive Service Facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539.

"BAT/BCT Criteria" means treatment-based standards for reducing the discharge of pollutants, as defined in 40 CFR subchapter N, for specific categories of industrial facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards. Effluent limitations have been defined in 40 CFR for the reduction of toxic pollutants using Best Available Technology Economically Achievable (BAT) and for the reduction of conventional pollutants using Best Conventional Pollutant Control Technology (BCT).

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

"Beneficial Uses" means the existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

"Best Management Practices (BMPs)" are methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Construction" means constructing, clearing, grading, or excavation that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it

enter the storm drain, within times specified in subsections 2 and 3 below.

2. Illicit Connections

a) Baseline Screening: All Permittees shall continue to screen the storm drain system for illicit connections during scheduled infrastructure maintenance. On an annual basis, Permittees shall report, to the Lead Permittee, on the location and length of open channels or closed storm drains that have been screened, and on the status of suspected, confirmed, and terminated illicit connections.

b) Priority Screening: In addition to the baseline screening that will occur during regularly scheduled maintenance, Permittees shall design and implement a plan on or before October 31, 2002, subject to Regional Board Executive Officer approval, for proactive storm drain screening of priority areas that are, or are suspected to be a source of non-storm water discharges.

c) Investigation: Upon discovery through either baseline or priority screening, or upon receiving a report of a suspected illicit connection, Permittees shall initiate an investigation within 21 days, to determine the source of the connection, the nature and volume of discharge through the connection, and the responsible party for the connection.

d) Termination: Upon confirmation of the illicit nature of a storm drain connection, Permittees shall ensure termination of the connection within 180 days, using enforcement authority as needed. For those cases of illicit connections that require more than 180 days to eliminate due to lengthy court proceedings, the Regional Board Executive Officer may grant time extensions on a case by case basis.

3. Illicit Discharges

a) Abatement and Cleanup: Respond, within 72 hours of discovery or a report of a suspected illicit discharge, with activities to abate, contain, and clean up all illicit discharges, including hazardous substances.

b) Investigation: As soon as practicable, during or immediately following containment and cleanup activities, take enforcement action as appropriate.

Part 5. DEFINITIONS

The following are definitions for terms applicable to this Order:

"Adverse Impact" means a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

include emergency construction activities required to immediately protect public health and safety.

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

"Dechlorinated Swimming Pool Discharge" means swimming pool discharges which have no measurable chlorine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

"Development" shall mean any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction.

"Directly Adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Director" shall mean the Director of Public Works of the County and Person(s) designated by and under the Director's instruction and supervision.

"Directly Discharging" means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

"Discharge" when used without qualification means the "discharge of a pollutant."

"Discharge of a Pollutant" means: Any addition of any "pollutant" or combination of pollutants to "waters of the United States" from any "point source" or, Any addition of any pollutant or combination of pollutants to the waters of the "contiguous zone" or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works. This term does not include an addition of pollutants by any "indirect Discharger."

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Effluent limitation" means any restriction imposed by the Regional Board on quantities, discharge rates, and concentrations of "pollutants" which are "discharged" from "point sources" into "waters of the United States," the waters of the "contiguous zone," or the ocean.

"Environmentally Sensitive Areas" means an area "in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments" (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are: areas designated as Significant Ecological Areas by the County of

Los Angeles (*Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Game, Significant Natural Areas Program; an area listed in the Regional Board Basin Plan as supporting the "Rare, Threatened, or Endangered Species (RARE)" beneficial use; or an area identified by the Permittees as environmentally sensitive for water quality purposes[1]. See Attachment B for details of each listing.

"Executive Advisory Committee" means the committee composed of representatives of the Los Angeles County Flood Control District, the City of Los Angeles, and the five Watershed Management Areas.

"General Construction Activities Storm Water Permit (GCASP)" is the general NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of storm water from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" is the general NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of storm water from certain industrial activities under certain conditions.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

"Illicit Connection" shall mean any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit Discharge" means any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes all non storm-water discharges except discharges pursuant to an NPDES permit, discharges that are identified in Part 1 of this order, and discharges authorized by the Regional Board Executive Officer.

"Illicit Disposal" means any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water.

"Industrial/Commercial Facility" means any facility involved and/or used in either the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Infiltration" means the downward entry of water into the surface of the soil.

"Large Municipal Separate Storm Sewer System (MS4)" means all MS4s that serve a population greater than 250,000. The complete definition is contained in 40 CFR Section 122.26 (b)(4). The Regional Board designated Los Angeles County as a large MS4 in 1990,

[1] Regional Board is currently working with the City of Rancho Palos Verdes to recognize their identified local conservation areas

based on: (i) the U.S. Census Bureau 1990 population estimate of 8.9 million, and (ii) the interconnectivity of the MS4s in the incorporated and unincorporated areas within the County.

"Local SWPPP" means the Storm Water Pollution Prevention Plan required by the local agency if the project is not subject to the Statewide Construction Activities General Permit.

"Maximum Extent Practicable (MEP)" means the standard for implementation of storm water management programs to reduce pollutants in storm water. It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility. Section 402(p)(3)(B)(iii) of the CWA requires that municipal permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

"Method Detection Limit (MDL)" is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

"Minimum Level (ML)" is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body, that is designed or used for collecting or conveying storm water, which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

"National Pollutant Discharge Elimination System (NPDES)" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under sections 307, 402, 318, and 405 of CWA. The term includes an "approved program."

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-Storm Water Discharge" means any discharge to a storm drain that is not composed entirely of storm water.

"Nuisance" means anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent

of the annoyance or damage inflicted upon individuals may be unequal; (3) occurs during, or as a result of, the treatment or disposal of wastes.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used personally, for businesses or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Permit" means an authorization, license, or equivalent control document issued by USEPA or an "approve State" to implement the requirements of 40 CFR Parts 122, 123, and 124. "Permit" includes an NPDES "general permit" (§ 122.28). Permit does not include any permit which has not yet been the subject of final agency action, such as a "draft permit" or a "proposed permit."

"Permittee(s)" means Co-Permittees and any agency named in this Order as being responsible for permit conditions within its jurisdiction. Permittees to this Order include the Los Angeles County Flood Control District, Los Angeles County, and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

"Pollutants" means those "pollutants" defined in Section 502(6) of the federal Clean Water Act (33.U.S.C.§1362(6)), or incorporated into California Water Code §13373. Examples of pollutants include, but are not limited to the following:

- Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash, and sludge);
- Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and non-metals such as phosphorus and arsenic;
- Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants, and grease)
- Excessive eroded soils, sediment, and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the State;
- Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables, and show facilities);
- Substances having characteristics such as pH less than 6 or greater than 9, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus;

The term "pollutant" shall not include uncontaminated storm water, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

The term "pollutant" also shall not include any substance identified in this definition, if through compliance with the best management practices available, the discharge of such substance has been eliminated to the maximum extent practicable. In an enforcement action, the burden shall

be on the person who is the subject of such action to establish the elimination of the discharge to the maximum extent practicable through compliance with the best management practices available.

"Potable Water Distribution Systems" means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, well development, pump testing fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

"Priority Pollutants" are those constituents referred to in 40 CFR 401.15 and listed in the USEPA NPDES Application Form 2C, pp. V-3 through V-9.

"Project" means all development and land disturbing activities. The term is not limited to "Project" as defined under California Environmental Quality Act (Pub Resources Code Section 21065).

"Rain Event" means any rain event greater than 0.1 inch in 24 hours.

"Receiving Waters" means all surface water bodies within the permit area that are identified in the Basin Plan.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces. Where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where redevelopment results in an increase in less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the addition must be mitigated, and not the entire development.

"Regional Administrator" means the Regional Administrator of the Regional Office of the Environmental Protection Agency or the authorized representative of the Regional Administrator.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of many base flow components either contaminated with pollutants or uncontaminated.

"Side Walk Rinsing" means pressure washing of paved pedestrian walkways with average water usage of 0.006 gallons per square foot, with no cleaning agents, and properly disposing of all debris collected, as authorized under Regional Board Resolution No. 98-08.

"Site" means the land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"SQMP" shall mean the Los Angeles Countywide Stormwater Quality Management Program.

"Storm Water Pollution Prevention Plan (SWPPP)" shall mean a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

"Storm Water" shall mean storm water runoff, snow melt runoff, and surface runoff and drainage.

"Stormwater Quality Management Program" shall mean the Los Angeles Countywide Stormwater Quality Management Program, which includes descriptions of programs, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law, as the same is amended from time to time.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both treatment control BMPs and source control BMPs.

"SUSMP" means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address conditions and requirements of new development.

"Total Maximum Daily Load (TMDL)" means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

"Toxicity Identification Evaluation" means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

"Toxicity Reduction Evaluation" is a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

"USEPA Phase I Facilities" are facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

"Water Column Toxicity" means a 70 percent survival rate for a single test or an average of 90 percent survival for three consecutive tests.

"Water Quality Standards and Water Quality Objectives" applicable to the Permittee include those contained in the Los Angeles Regional Water Quality Control Plan (Basin Plan), the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

"Waters of the State" means any surface water or groundwater, including saline waters, within boundaries of the state.

"Waters of the United States" or "Waters of the U.S." means:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
b. All interstate waters, including interstate "wetlands";
c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    3. Which are used or could be used for industrial purposes by industries in interstate commerce;
d. All impoundments of waters otherwise defined as waters of the United States under this definition;

e. Tributaries of waters identified in paragraphs (a) through (d) of this definition;
f. The territorial sea; and
g. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with US EPA.

"Wet Season" means the calendar period beginning October 1 through April 15.

"Whole Effluent Toxicity" means the aggregate toxic effect of an effluent measured directly by a toxicity test.

Part 6. STANDARD PROVISIONS

A. Standard Requirements

1. The Permittees shall comply with all provisions and requirements of this permit.

2. Should the Permittees discover a failure to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

3. The Permittees shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.

4. This Order includes the attached Monitoring and Reporting Program, and Standard Urban Storm Water Mitigation Plan, which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

R0002965

B. Regional Board Review

1. Any formal determination or approval made by the Regional Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Regional Board. Such review may be requested upon

petition by a Permittee(s) or a member of the public within 30 days of the effective date of the notification of such decision to the Permittee(s).

C. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. Section 552 (as amended) and the Public Records Act (California Government Code Section 6250 *et seq.*).

2. All documents submitted to the Regional Board Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

D. Duty to Comply

1. The Principal Permittee must comply with all of the terms, requirements, and conditions of this Order. Any violation of this order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a combination thereof [40 CFR 122.41(a), CWC Section 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, 13350].

2. A copy of these waste discharge specifications shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees and members of the public.

3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

E. Duty to Mitigate [40 CFR 122.41 (d)]

The Permittees shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

F. Inspection and Entry [40 CFR 122.41(i), CWC Section 13267]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;

2. Access to copy any records that are kept under the conditions of this Order;

3. To inspect any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,

4. To photograph, sample, and monitor for the purpose of assuring compliance with this Order, or as otherwise authorized by the Clean Water Act and the California Water Code.

G. Proper Operation and Maintenance [40 CFR 122.41 (e), CWC Section 13263(f)]

The Permittees shall at all times properly operate and maintain all facilities and systems of treatment and (and related appurtenances) that are installed or used by the Permittees to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Permittee only when necessary to achieve compliance with the conditions of this Order.

H. Signatory Requirements [40 CFR 122.41(k)]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of Public Works, City Engineer, or authorized designee under penalty of perjury.

I. Reopener and Modification [40 CFR 122.41(f)]

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements, and upon prior notice and hearing, to:

   a) Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;

   b) Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c) Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or,

d) Consider any other federal, or state laws or regulations that became effective after adoption of this Order.

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

a) Violation of any term or condition contained in this Order;

b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,

c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

3. This Order may be modified, revoked and reissued, or terminated for cause.

4. The filing of a request by the Principal Permittee for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

5. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR Part 122.63, if processed as a minor modification. Minor modifications may only:

a) Correct typographical errors, or

b) Require more frequent monitoring or reporting by the Permittee.

J. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected.

K. Duty to Provide Information [40 CFR 122.41(h)]

The Permittees shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Permittees shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

L. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)][2]

1. The Permittees shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time any Permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

2. The Regional Board may waive the required written report on a case-by-case basis.

M. Bypass [40 CFR 122.41(m)][3]

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited. The Regional Board may take enforcement action against Permittees for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.);

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;

3. The Permittee submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,

4. Permittees may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to

---

[2] This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the Los Angeles County SQMP are exceeded, and which endanger public health or the environment.

[3] This provision applies to the operation and maintenance of storm water controls and BMPs as provided in this Order or in the SQMP.

assure efficient operation. In such a case, the above bypass conditions are not applicable. The Permittee shall submit notice of an unanticipated bypass as required.

N. Upset [40 CFR 122.41(n)][4]

1. A Permittee that wishes to establish the affirmative defense of an upset in an action brought for non compliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

   a) An upset occurred and that the Permittee can identify the cause(s) of the upset;

   b) The permitted facility was being properly operated by the time of the upset;

   c) The Permittee submitted notice of the upset as required; and,

   d) The Permittee complied with any remedial measures required.

2. No determination made before an action for noncompliance, such as during administrative review of claims that non-compliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the Permittee seeking to establish the occurrence of an upset has the burden of proof.

O. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

P. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalties may be applied for each kind of violation. The Clean Water Act provides the following:

   a) Criminal Penalties for:

      (1) Negligent Violations:

      The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

[4] *Supra*. See footnote number 2.

(2) Knowing Violations:

The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

(3) Knowing Endangerment:

The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

(4) False Statement:

The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed of required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or by both. (See section 309(c)(4) of the Clean Water Act.)

b) Civil Penalties

The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

2. The California Water Code provides that any person who violates a waste discharge requirement provision of the California Water Code is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination violations.

Q. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

R. Modifications to this Order

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

1. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

2. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board, or amendments to the Basin Plan;

3. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or,

4. Any amendments under the Clean Water Act.

S. Rescission

Regional Board Order No. 96-054 is hereby rescinded.

T. Expiration

This Order expires on [October 25, 2006]. The Principal Permittee must submit a Storm Water Quality Management Plan in accordance with Title 23, California Code of Regulation, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Dennis A. Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on October 25, 2001.

ATTACHMENT B

DESCRIPTIONS OF ENVIRONMENTALLY SENSITIVE AREAS

Significant Ecological Areas (Table B-1, Figure B-1)

Definition: Significant Ecological Areas (SEAs) are defined and delineated in conjunction with the Land Use and Open Space Elements of the Los Angeles County General Plan. An area qualifies for recognition as an SEA if it possesses one or more of the following features, or classes:

1. The habitat of core populations of endangered or threatened plant or animal species.
2. On a regional basis, biotic communities, vegetative associations, and habitat of plant or animal species that are either unique or are restricted in distribution.
3. Biotic communities, vegetative associations, or habitat of plant or animal species that are either unique or are restricted in distribution.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas that would provide for the preservation of relatively undisturbed examples of the original natural biotic communities in Los Angeles County.

Description: Current SEAs are listed in Table B-1[1]. Los Angeles County has conducted a study to update the SEA designations. Proposed boundaries of SEAs are shown on Figure B-1[2]. When the proposed SEAs included in the SEA Update Study 2000 are finalized, they will replace the current SEAs. The SEA Update Study 2000, and individual reports for each SEA are posted on the Los Angeles County Department of Regional Planning website at http://planning.co.la.ca.us/drp_revw.html#SEA

Rare, Threatened, or Endangered Species (Table B-2)

Definition: Rare, Threatened, or Endangered Species (RARE) is a beneficial use for waterbodies in the Los Angeles Region that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

Description: Specific waterbody reaches that support the RARE beneficial use are listed in Table B-2[3]. The accompanying maps depict reach areas in each watershed.

[1] Same as Table 1-1 from the Regional Board Basin Plan
[2] Map from the Los Angeles County SEA Update Study
[3] Same as Table 2-1, Beneficial uses of Inland Surface Waters from the Regional Board Basin Plan

Significant Natural Areas (Figure B-2)

Definition: Significant Natural Areas (SNAs), defined by the Department of Fish and Game (DFG), Significant Natural Areas Program, are areas that contain important examples of California's biological diversity. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

1. Areas supporting extremely rare species or habitats.
2. Areas supporting associations or concentrations of rare species or habitats.
3. Areas exhibiting the best examples of rare species and habitats in the state.

These criteria are strictly biological and do not account for levels of protection or threat. Sites may or may not be well protected. Detailed information on site protection, quality, and conservation needs is most readily available at the local level. The DFG Significant Natural Areas Program states that the purpose of identifying these areas is to draw the attention of planners and managers to these areas. The identification of SNAs does not imply any additional authority by the DFG.

Description: See Figure B-2 for a map of SNAs in Los Angeles County. Detailed descriptions of each area are attached. SNA maps, reports, and shape files can be downloaded from the DFG website at ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/.

* Asterixed MUN designations are designated under SB 88-63 and RB 89-03. Some designations may be considered for exemptions at a later date. (See pages 2-3,4 for more details).

Footnotes are consistent on all beneficial use tables.

a Waterbodies are listed multiple times if they cross hydrologic area or subarea bounderies. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

b Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

c Coastal waterbodies which are also listed in Coastal Features Table (2-3) or in Wetlands Table (2-4).

d Limited public access precludes full utilization.

e One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.

f Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.

g Condor refuge.

h Water contact recreational activities prohibited by Casitas MWD

i Soledad Canyon is the habitat of the Unarmored Three-Spine Stickleback.

E, P, and I shall be protected as required
* Asterixed MUN designations are designated under SB 88-63 and RB 89-03. Some designations may be considered for exemptions at a later date. (See pages 2-3,4 for more details).

Footnotes are consistent on all beneficial use tables.

a Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.
b Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.
c Coastal waterbodies which are also listed in Coastal Features Table (2-3) or in Wetlands Table (2-4).
e One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting
f Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.
k Public access to reservoir and its surrounding watershed is prohibited by the Los Angeles Department of Water and Power.
w These areas are engineered channels. All references to Tidal Prisms in Regional Board documents are functionally equivalent to estuaries
m Access prohibited by Los Angeles County DPW in concrete-channelized areas
x Owner prohibits entry
u This reservoir is covered and thus inaccessible
z Listed twice in this table (see next page)

See pages 2-1 to 2-3 for descriptions of beneficial uses.

Footnotes are consistent for all beneficial use tables.

ac Beneficial uses for ground waters outside of the major basins listed on this table and outlined in Fig. 1-8 have not been specifically listed. However, ground waters outside of the major basins are, in many cases, significant sources of water. Furthermore, ground waters outside of the major basins are either potential or existing sources of water for downgradient basins, and as such, beneficial uses in the downgradient basins shall apply to these areas.

ed Basins are numbered according to California Department of Water Resources (DWR) Bulletin No. 118-80 (DWR, 1980).

ae Ground waters in the Pitas Point area (between the lower Ventura River and Rincon Point) are not considered to comprise a major basin and, accordingly, have not been designated a basin number by the DWR or outlined on Fig. 1-8.

af The Santa Clara River Valley (4-4), Pleasant Valley (4-6), Arroyo Santa Rosa Valley (4-7), and Las Posas Valley (4-8) Ground Water Basins have been combined and designated as the Ventura Central Basin (DWR, 1980).

E Existing beneficial use
P Potential beneficial use
See pages 2-1 to 2-3 for descriptions of beneficial uses.

Footnotes are consistent for all beneficial use tables.

ac Beneficial uses for ground waters outside of the major basins listed on this table and outlined in Fig. 1-9 have not been specifically listed. However, ground waters outside of the major basins are, in many cases, significant sources of water. Furthermore, ground waters outside of the major basins are either potential or existing sources of water for downgradient basins, and as such, beneficial uses in the downgradient basins shall apply to these areas.

ad Basins are numbered according to DWR Bulletin No. 118-80 (DWR, 1980).

ag The category for the Foothill Wells area in the old Basin Plan incorrectly grouped ground water in the Foothill area with ground water in the Sunland-Tujunga area. Accordingly, the new categories, Foothill area and Sunland-Tujunga area, replace the Foothill Wells area.

ah Nitrite pollution in the groundwater of the Sunland-Tujunga area currently precludes direct MUN uses. Since the ground water in this area can be treated or blended (or both), it retains the MUN designation.

al All of the ground water in the Main San Gabriel Basin is covered by the beneficial uses listed under Main San Gabriel Basin-eastern area and western area. Walnut Creek, Big Dalton Wash and Little Dalton Wash separate the eastern area from the western area (see dashed line on Fig. 2-17). Any ground water upgradient of these areas is subject to downgradient beneficial uses and objectives, as explained in Footnote ac.

aj The border between Regions 4 and 8 crosses the Upper Santa Ana Valley Ground Water Basin.

ak Ground water in the Conejo-Tierra Rejada Volcanic Area occurs primarily in fractured volcanic rocks in the western Santa Monica Mountains and Conejo Mountain areas. These areas have not been delineated on Fig. 1-9 have not been designated a basin number by DWR or outlined on Fig. 1-9.

am DWR has not designated basins for ground waters on the San Pedro Channel Islands.

E: Existing beneficial use
P: Potential beneficial use
I: Intermittent beneficial use
E, P, and I shall be protected as required

Footnotes are consistent for all beneficial use tables.

a Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries
Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed seperately.

b Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody
Any regulatory action would require a detailed analysis of the area.

c Coastal waterbodies which are also listed in Inland Surface Waters Table (2-1) or in Wetlands Table (2-4).

e One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting

f Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development.
This may include migration into areas which are heavily influenced by freshwater inputs.

er Areas exhibiting large shellfish populations include Malibu, Point Dume, Point Fermin, White Point and Zuma Beach

es Most frequently used grunion spawning beaches. Other beaches may be used as well

w These areas are engineered channels. All references to Tidal Prisms in Regional Board documents are functionally equivalent to estuaries.

Table 2-3. Benefical Uses of Coastal Features (Continued).

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

MONITORING AND REPORTING PROGRAM - CI 6948

FOR

MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES, EXCEPT THE CITY OF LONG BEACH

(NPDES PERMIT NO. CAS004001)

I. Program Reporting Requirements

A. Program Management

Permittees shall submit, no later than (3 months following the adoption of this Order), the Annual Storm Water Report and Assessment (Annual Report) for the period July 1, 2000, through October 25, 2001 documenting the status of the storm water management program (Program) up to permit reissuance and the results of analyses from the monitoring and reporting program.

The Principal Permittee shall submit, by October 15 of each year beginning the year 2002, an Annual Report documenting the progress of Permittee implementation of the Storm Water Quality Management Plan (SQMP) and the requirements of this Order. An integrated summary of the results of analyses from the Monitoring Program described under *II. Monitoring Requirements* shall also be included. The Principal Permittee shall evaluate the Annual Report with the results of analyses from the Monitoring Program (e.g. if the monitoring results show a particular constituent consistently at elevated levels, that may be a trigger for Permittees to address their programs specifically for that particular situation and change them accordingly to address the problem).

The Annual Report shall cover each fiscal year from July 1 through June 30. At a minimum, the Annual Report will include the following:

1. All proposed changes to the SQMP as approved by the Executive Advisory Committee (EAC).

2. A comparison of program implementation results to performance standards established in this Order and in the SQMP.

3. Status of compliance with permit requirements including implementation dates for all time-specific deadlines. If permit deadlines are not met, Permittees shall report the reasons why the requirement was not met, how the requirements will be met in the future, including projected implementation date.

4. An assessment of the effectiveness of SQMP requirements to reduce storm water pollution. This assessment will be based upon the specific record-keeping information requirement in each major section of the

permit, monitoring data, and any other information related to program effectiveness. Beginning in the Year 2002, to the extent that data collected in monitoring requirements included herein and existing monitoring data allows, the Principal Permittee shall include an analysis of trends, land use contributions, pollutant source identifications, BMP effectiveness, and impacts on beneficial uses.

5. An analysis of the data to identify areas of the Program coverage which cause or contribute to exceedances of water quality standards or objectives, predominate land uses in these areas, and potential sources of pollutants in those areas.

6. Discussion of the compliance record and the corrective actions taken or planned that may be needed to bring the discharge into full compliance with the waste discharge requirements.

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall submit an annual PIPP Update to the Regional Board Executive Officer for approval. The PIPP Update shall include a summary of the overall strategy and any updates or modifications to the PIPP.

Programs for Residents

1. Number of storm drain inlets and designated public access points to creeks, channels, and other relevant water bodies in each Permittees' systems that are marked or posted with a no dumping message. If the requirement that 100 percent of storm drains inlets are marked/signed is not met, each Permittee shall report the reasons why, and how the requirement will be met in the future, including the implementation date.

2. Description of activities on distributing brochures, community outreach efforts, public communication efforts and educational programs in schools including an estimate of the number of impressions per year made on the general public about storm water quality via print, local TV access, local radio presentations, meetings or other appropriate media.

3. Description of the quarterly Public Outreach Strategy meetings, including percentage of Permittee attendance, effectiveness at coordinating Permittee education programs, and overall effectiveness based on Permittee evaluations. Also, a description of each Permittee's participation in and contribution to the PIPP.

4. Description of activities for the Pollutant-Specific Outreach programs, including creating and distributing outreach materials to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate counters and events.

Programs for Businesses

1. Description of the Corporate Outreach program, including the number of consultations with corporate-level management of gas stations and restaurant chains and the percentage of the total.

2. Description of the Business Assistance Program, including the number of businesses that requested assistance and the number that were assisted through site visits, telephone consultations, presentations, or material distribution.

C. Industrial/Commercial Facilities Program

1. An annual update of the watershed-based inventory of all Industrial/Commercial sites identified as a threat to water quality. This includes all Phase I industrial facilities, motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, restaurants, and other facilities that contribute or have the potential to contribute to impairments of receiving waters. The inventory shall include at a minimum: facility name, site address, SIC code and narrative description of activities performed at each facility.

2. Number of restaurants, automotive businesses, industrial facilities, and other commercial facilities targeted under the program. During the past year, the number of industrial and commercial inspections conducted, the number of non-compliant sites, and the number of industrial facilities the Permittees have identified that have failed to file an NOI.

3. The percentage of targeted staff trained annually.

D. Development Planning Program

1. Total number and percent of all development projects reviewed and conditioned to meet SUSMP requirements by category such as residential, commercial, and industrial.

2. Total square feet of impervious area conditioned for mitigation by development and redevelopment category.

3. Significant date rewrite completed of General Plan with storm water considerations.

4. Percent and total number of targeted staff trained annually [100 percent].

5. Date CEQA guidelines revision completed to include storm water mitigation conditions.

6. Date BMP design and sizing technical manual completed and made available electronically.

E. Construction Development Program

1. Number of construction projects requiring local SWPPPs in the past year and the percentage of projects in categories requiring submittal of a local SWPPP for which local SWPPPs were completed.

2. Number and type of enforcement actions, applicable to storm water enforcement, taken at construction sites during the past year.

3. Description of the outreach program to the construction community and assessment of its effectiveness; This assessment should include a discussion of the number of inspections, or other meetings conducted.

4. The percentage of targeted staff trained annually.

F. Illicit Connections and Illicit Discharges Elimination Program

1. Annual update of the analytical tool used to manage and track illicit connections and discharges, including an evaluation of patterns and trends of illicit connections and illicit discharges in the entire storm drain system.

2. Location and length of open channels and closed storm drains that were screened by all Permittees, and the status of all suspected, confirmed, and terminated illicit connections.

3. Number of reports of illicit discharges that Permittees responded to, percentage that were identified as actual illicit discharges, and percentage of the actual illicit discharges where the incident was either cleaned up, referred to another responsible agency and/or follow up/education with the discharger was conducted.

4. Percentage of cleanup and abatement activities that occurred within 72 hours of discovery or report of a suspected illicit discharge and justification for response activities that exceeded 72 hours.

5. For groups of identified illicit discharge types where the probable causes for the discharge can be identified, report probable causes and the actions taken to prevent similar discharges from occurring.

6. Number of illicit connections identified in the past year.

7. Percentage of investigations that were initiated within 21 days of identification or a report of an illicit connection and justification for those that exceeded 21 days.

8. Number of illicit connections eliminated in the past year.

9. Percentage of illicit connections terminated within 180 days of identification and justification for terminations that exceeded 180 days.

10. Number and type of enforcement actions for storm water illicit discharges and/or illicit connections taken in the past year.

11. A summary from records on illicit discharges and connections which includes description of discharge, source, and enforcement action taken.

12. A summary from records on illicit connections which includes the number of illicit connections terminated by the issuance of a connection permit and those terminated by removal of the connection. This summary shall also include a breakdown of identified illicit connections by land use.

13. The percentage of targeted employees trained annually.

G. Programs for Facilities Maintenance

1. A summary which at a minimum includes the quantity, predominant types and likely sources of trash removed from catch basin inlets.

2. A summary of the total curb miles of streets swept annually and the percentage of total curb miles swept annually as a function of total curb miles.

3. The percentage of targeted staff trained annually.

H. Pollutants of Concern

1. A progress report on sources of pollutants of concern, BMPs for their control, and implemented BMP effectiveness.

I. Monitoring Program Management

1. The Principal Permittee shall submit a Storm Water Monitoring Report (Monitoring Report) on August 15, 2002, and annually on August 15, thereafter. The report shall include:

a) Status of implementation of the monitoring program

b) Results of the monitoring program

c) A general interpretation of the results

d) Data, results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each component of the monitoring program, including any specific reporting requirements included in Section II. Monitoring Program

e) An analysis of trends, land use contributions, pollutant source identifications, BMP effectiveness, and impacts on beneficial uses

f) Suggestions for improvements to the SQMP based on the analysis

g) All monitoring reports shall be submitted in both electronic and paper formats

2. The Principal Permittee shall

3. The Principal Permittee shall submit, no later than (3 months following the adoption of this Order), the results of analyses from the monitoring and reporting program for the period July 1, 2000 through October 25, 2001 together with the Annual Report for the same period.

J. All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k). Each report shall contain the following completed declaration:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Executed on the ___ day of _____ , 20_,

at _____.

(Signature)_____(Title)_____";

Permittee submittals to the Principal Permittee shall also be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k).

The Principal Permittee shall mail the original of each annual report to:

INFORMATION TECHNOLOGY
CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
320 W. 4TH STREET, SUITE 200
LOS ANGELES, CA 90013

A copy of the annual report shall also be mailed to:

REGIONAL ADMINISTRATOR
ENVIRONMENTAL PROTECTION AGENCY
REGION 9
75 Hawthorne Street
San Francisco, CA 94105

R0003044

II. Monitoring Program

The primary objectives of the Los Angeles County Storm Water Quality Monitoring Program include, but are not limited to: 1) assessing compliance with this Order; 2) measuring and improving the effectiveness of the SQMPs; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water

discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality. Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMPs for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee shall implement the Countywide Storm Water Monitoring Program as follows:

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality objectives by comparing results to objectives in the Basin Plan, Ocean Plan, and with emissions from other dischargers.

1. The Principal Permittee shall monitor mass emissions from the following seven mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and the Santa Clara River (location to be determined prior to the adoption of this Order). The Principal Permittee shall monitor the first storm event and a minimum of 2 additional storm events for each season. A minimum of two dry weather samples per year at each mass emission station shall also be analyzed.

2. All storms, in addition to those required above, totaling at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents and provide a more accurate estimate of median mass emissions (pollutant correlation with TSS). This requirement does not apply to manual sampling stations.

3. Samples for mass emission station monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms totaling 0.25 inches or greater of rainfall. Samples taken at mass emission stations during the first storm event should be analyzed for all constituents listed in Attachment U-1. The Principal Permittee may elect not to sample Volatile Organic Compounds from the list of constituents for mass emission stations.

4. Manual samples shall be collected from mass emission stations where it is not feasible to install an automatic sampler (Santa Clara River). Manual samples shall be time-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[1], unless the Regional Board Executive Officer approves alternate protocol.

[1] Provisions for flow-weighted composite samples set forth in 40 CFR 122.21(g)(7)

5. For the first storm of each year, method detection limits (MDLs) lower than or equal to the minimum levels identified in the State Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2000 (SIP) shall be used. These levels are listed in column A in Attachment U-1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment U-1, the higher MDLs may be used for the remaining sampling events of that year. If a constituent has been detected in 100 percent of samples during the last 2 years of monitoring, the Principal Permittee may continue to use the MDLs listed in column B until the constituent is not detected, afterwhich, the method detection limits shall be lowered to those in column A.

6. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment U-1 in more than 25 percent of the first ten sampling events or on a rolling basis using ten consecutive sampling events, it need not be further analyzed, with the exception of the first storm of each season, unless the observed occurrences show high concentrations and are cause for concern.

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze two wet weather samples and two dry weather samples from each mass emission station for toxicity per year. A minimum of one freshwater and one marine species shall be used for toxicity testing. Specifically, Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization shall be used. Only Ceriodaphnia dubia shall be used for toxicity testing of samples from the Santa Clara mass emission station. If toxicity is not detected in either of the dry weather samples for any given mass emission station, the Principal Permittee may reduce dry weather toxicity testing to one sample per year at that station. If toxicity is not detected in either of the wet weather samples for any given mass emission station, wet weather toxicity testing may be reduced to one sample from the first storm of the wet season per year at that station.

2. Toxicity Identification Evaluations (TIE)

The Principal Permittee shall conduct Phase I TIEs on wet weather samples when two consecutive samples from the same monitoring station show toxicity and on dry weather samples when two consecutive dry weather samples from the same monitoring station show toxicity.

R0003046

3. Toxicity Reduction Evaluations (TRE)

a) The Principal Permittee shall perform a TRE for each pollutant or pollutant class that is identified as toxic. TREs shall include the following:

(1) An analysis of possible sources of toxicity, the identification of appropriate BMPs to eliminate toxicity and a time schedule for toxicity reduction that considers BMP implementation and effectiveness time. The Principal Permittee, Regional Board staff, and a third party will collaborate to develop and evaluate the analysis and recommendations.

(2) Submittal of the analysis to the Regional Board Executive Officer for approval.

The Principal Permittee may use EPA manual EPA/833B-99/002 (municipal) as guidance for TRE preparation.

b) Upon approval by the Regional Board Executive Officer, each Permittee having jurisdiction over sources causing or contributing to storm water toxicity shall be responsible for implementing the recommended BMPs to reduce toxicity.

c) During TRE development and implementation, the Principal Permittee shall continue monitoring the first storm and one dry weather event per year for toxicity at the subject station. According to the time schedule included in the TRE, the Principal Permittee shall analyze two wet weather and two dry weather samples for toxicity to evaluate the effectiveness of the TRE.

d) The Principal Permittee shall conduct a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds.

e) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Tributary/Source Identification Monitoring

The Principal Permittee shall monitor select tributaries to identify sources of pollutants in subwatersheds, prioritize locations that need management actions, provide baseline information for TMDL development and allocate pollutant loads for TMDL development. An additional purpose of this monitoring is to validate the Land Use Model.

1. The Principal Permittee shall develop and implement a tributary/source identification monitoring program[2]. The following tributaries which have

[2] The Principal Permittee is currently working with Regional Board staff to modify this program

R0003047

been identified as contributing the greatest loads of metals per acre in each subwatershed (based on the last four years of data for land use type, area, and rainfall) shall be monitored:

a) Centinela Creek (Ballona Creek WMA)
b) Kenter Canyon (Ballona Creek WMA)
c) Aliso Creek (Los Angeles River WMA)
d) Bull Creek (Los Angeles River WMA)
e) Compton Creek (Los Angeles River WMA)
f) Los Cerritos Channel (San Gabriel River WMA)
g) San Jose Creek (San Gabriel River WMA)

2. The Principal Permittee shall begin monitoring in the Los Angeles River watershed in the 2001-2002 storm season, and the San Gabriel River and Ballona Creek watersheds no later than the 2002-2003 storm season.

3. The Principal Permittee shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be time-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[3], unless the Regional Board Executive Officer approves alternate protocol. Samples shall be taken just upstream of the tributary's confluence with the mainstem. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, and total suspended solids

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) All other constituents for which the water body is impaired[4].

d) Flow (flow may be estimated using EPA methods[5] at sites where flow measurement devices are not in place).

5. For the first storm of each year, MDLs lower than or equal to the minimum levels identified in the SIP shall be used. These levels are listed in column A in Attachment U-1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment U-1, the higher MDLs may be used for the remaining sampling events of that year.

---

[3] Provisions for flow-weighted composite samples set forth in 40 CFR 122.21(g)(7)

[4] The 1998 California 303(d) List and TMDL Priority Schedule lists pollutants for which each water body is impaired, www.swrcb.ca.gov/tmdl/docs/303d98.pdf#reg4

[5] NPDES Storm Water Sampling Guidance Document, EPA 833-B-92-001, July 1992

6. The Principal Permittee shall submit a report identifying sources and/or source areas of pollutants within each watershed and priority management actions as part of the fourth Monitoring Report, to be submitted in 2005. The SQMP shall be modified to reflect the identified priority management actions.

D. Shoreline Monitoring

The City of Los Angeles shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from urban runoff. This component should be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the State of California's bathing water standards for public beaches and ocean water-contact sport areas[6], and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

   a) The eighteen established shoreline water quality stations listed in Attachment U-2 shall be monitored. Station locations may be modified based on recommendations from the Santa Monica Bay Restoration Project (SMBRP) and approval from the Regional Board Executive Officer;

   b) Three indicator groups shall be tested for using either membrane filtration, multiple tube fermentation, or chromogenic substrate test kits. Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	6/week (Mon-Sat)[7]
Fecal Coliform[8]	CFU or MPN/100 ml	6/week (Mon-Sat)[5]
Enterococcus	CFU or MPN/100 ml	6/week (Mon-Sat)[5]

[6] California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765

[7] Samples will be collected on Sundays preceding Monday holidays

[8] *Escherichia Coli (E. Coli)* may be substituted for Fecal Coliform if chromogenic substrate test kits are used

c) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;

d) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches and their proximity to storm drains, as recommended by the SMBRP's Technical Advisory Committee and the Los Angeles County Department of Health Services (DHS).

e) Data collected shall be transmitted daily to the Los Angeles County DHS. Data shall be assessed annually and presented in the Annual Report;

f) When exceedances of public health standards for bacteria occur, the Principal Permittee shall notify the appropriate Permittees. Permittees shall initiate an investigation to determine the source, as required in the Program to Eliminate Illicit Connections and Discharges (Part 4.F.2.c.).

g) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the Santa Monica Bay Restoration Project regional program for the Santa Monica Bay.

E. Trash Monitoring

The Principal Permittee and the Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Attachment A) shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds. The Principal Permittee is encouraged to implement the program in the watersheds that are not presently listed on the 303(d) list for impairment for trash.

The Principal Permittee shall participate on regional monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Regional Monitoring participation shall include, but not necessarily be limited to, the efforts described below.

F. Estuary Sampling

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the southern California bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. A similar bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this bight-wide monitoring project, and should complete the estuary sampling requirement described below in parallel with this effort.

In addition to participation in the Bight-wide study, the goal of this requirement is to sample estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertibrate community to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary which depicts the impacted areas shall be produced. The maps shall provide the information necessary to conduct effective sediment monitoring to determine trends and accumulation, as a future permit requirement.

1. The Principal Permittee shall sample a maximum of 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit cycle. Sediment samples shall be taken at each station by means of a $0.1m^2$ ($1.1 ft^2$) modified Van Veen sediment grab sampler.

2. The Principal Permittee shall also sample a total of 25 sites outside of the direct outfalls to assess cumulative effects.

3. All samples shall be analyzed for the following:
   a) Sediment Chemistry (priority pollutants)
   b) Total Organic Carbon (TOC)
   c) Grain size
   d) Sediment Toxicity
      (1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.
      (2) Phase I TIEs of interstitial water, using Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.
   e) Benthic Macroinvertibrates
      (1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.
      (2) The Principal Permittee shall identify all organisms to lowest possible taxon.
      (3) The Principal Permittee shall determine the Total Biomass of:
         (i) Mollusks
         (ii) Echinoderms
         (iii) Annelids/polychaetes
         (iv) Crustaceans
         (v) All other macroinvertebrates

R0003051

(4) The Principal Permittee shall determine the community structure analysis, including wet weight of each taxonomic group (listed above), number of species, number of individuals per species, total numerical abundance, species abundance per grab, species richness, species diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index[9].

4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water.

G. Bioassessment

The Principal Permittee shall continue participation on the Southern California Stormwater Research/Monitoring Program committee (coordinated by SCCWRP). The Regional Board anticipates that this program will organize an effort to evaluate the biological index approach for southern California and to design a research project for developing an Index of Biological Integrity (IBI) for this region. The Principal Permittee shall participate in this regional effort at least to the extent described below.

The purpose of this requirement is to detect biological trends in receiving waters and to collect data for the development of an IBI for southern California.

1. The Principal Permittee shall coordinate with the Southern California Stormwater Research/Monitoring Program and with the Surface Water Ambient Monitoring Program (SWAMP) being developed by the Regional Board to identify the most appropriate locations for bioassessment stations within Los Angeles County.

2. Station selection shall be complete within one year from the date this Order is adopted, and sampling shall begin in October of 2003.

3. The Principal Permittee shall monitor a minimum of 20 station events per year (either 20 stations in October of each year, or 10 stations in May and October of each year). A minimum of three replicate samples shall be collected at each station during each sampling event.

4. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized "Non-point Source Bioassessment Sampling Procedures" for professional bioassessment as set forth in the California Department of Fish and Game California Stream Bioassessment Procedure (CSBP)[10]. The following results shall be included in the annual Monitoring Report:

[9] Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the SCCWRP
[10] California Stream Bioassessment Procedure (Protocol Brief for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game - Aquatic Bioassessment Laboratory, May 1999. Located at www.dfg.ca.gov/cabw/protocols.html.

a) All physical, chemical and biological data collected in the assessment;

b) Photographic documentation of assessment and reference stations;

c) Documentation of quality assurance and control procedures;

d) Analysis that shall include calculation of the metrics used in the CSBP;

e) Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;

f) Electronic data formatted to the California Department of Fish and Game Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database.

5. A professional environmental laboratory shall perform all sampling, laboratory, quality assurance, and analytical procedures.

H. New Development Impacts Study in the Santa Clara Watershed

The Principal Permittee and the City of Santa Clarita shall monitor tributaries in the Santa Clara watershed to determine impacts from new development and to compare storm water quality between subwatersheds with and without SUSMPs.

1. The Principal Permittee and the City of Santa Clarita shall select one station that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation, and one station (SUSMP station) in a subwatershed in which the majority of the development has/will include SUSMP implementation. Other inputs to runoff, such as septic systems, in the two subwatersheds should be similar.

2. The Principal Permittee shall coordinate with the City of Santa Clarita and the Regional Board to develop a proposed study design, including a description of the drainage areas to be monitored and sampling locations, no later than 180 days from the date this Order is adopted. If appropriate, this study may be conducted in conjunction with the Peak Discharge Impact Study, described in Section I.

3. The Principal Permittee and the City of Santa Clarita shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be time-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within

each hour of discharge[11], unless the Regional Board Executive Officer approves alternate protocol. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, chloride, nitrogen, and TSS

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) Pathogen Indicators (Coliform)

d) Flow (flow may be estimated using EPA methods at sites where flow measurement devices are not in place)

5. For the first storm of each year, MDLs lower than or equal to the minimum levels identified in the SIP shall be used. These levels are listed in column A in Attachment U-1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment U-1, the higher MDLs may be used for the remaining sampling events of that year.

6. The Principal Permittee and the City of Santa Clarita shall submit an analysis of the data, including a description of each subwatershed, year-to-year changes compared to the amount of development that occurred in each, comparisons between stations, and an analysis of SUSMP effectiveness, with the fifth year Monitoring Report.

I. Peak Discharge Impact Study

The Principal Permittee shall participate in a study to evaluate peak storm water discharge rate (PDR) control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization (Part 4.C.2.). The Principal Permittee may partner with the Ventura County Flood Control District to extend their stream erosion study to the Santa Clara River watershed. The study shall begin no later than 360 days from the date this Order is adopted.

J. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control storm water best management practices. The objectives of this study shall include the following:

[11] Provisions for flow-weighted composite samples set forth in 40 CFR 122.21(g)(7)

R0003054

1. Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year proceeding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.

2. Evaluate the requirements, feasibility and cost of maintenance for each BMP.

3. Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the Santa Monica Bay Restoration Foundation's proposed study, "Performance Evaluation of Structural BMPs for Storm water Pollution Control in the Santa Monica Bay Watershed" to meet this requirement. Participation includes collaboration and resource contribution to expand the scope of the proposed study.

K. Standard Monitoring Provisions

1. The Principal Permittee shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

Records of monitoring information shall include:

a) The date, exact place, and time of sampling or measurements;

b) The individual(s) who performed the sampling or measurements;

c) The date(s) analyses were performed;

d) The individual(s) who performed the analyses;

e) The analytical techniques or methods used; and,

f) The results of such analyses.

2. All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.

3. All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

4. If no flow occurred during the reporting period, the Monitoring Report shall so state.

5. For any analyses performed for which no procedure is specified in the EPA guidelines or in this Monitoring Program, the constituent or parameter analyzed and the method or procedure used must be specified in the Monitoring Report.

6. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring Program, after providing the opportunity for public comment, either:

   a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the annual Monitoring Report. Such petition shall be filed not later than 60 days after the Monitoring Report submittal date, or

   b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.

Second Draft (June 29, 2001)

FACT SHEET/STAFF REPORT

FOR THE

COUNTY OF LOS ANGELES MUNICIPAL STORM WATER NPDES PERMIT (CAS004001)

Los Angeles Regional Water Quality Control Board

TABLE OF CONTENTS

Second Draft – FACT SHEET/STAFF REPORT

State of California
California Regional Water Quality Control Board Los Angeles Region
National Pollutant Discharge Elimination System (NPDES)
Permit No. CAS004001, CI 6948
Regional Board Order No. 01-XXX

I. PURPOSE

The purpose of this Fact Sheet/Staff Report is to give the Permittees and interested parties an overview of the proposed permit as well as to provide the technical basis for the permit requirements. Sections I through IV describe water quality problems from urban runoff, and permit conditions to address these problems. Sections V and VI contain discuss each major element of the Permittees' Storm Water Quality Management Plan (SQMP), and is meant to be used as a reference document during review of the permit.

II. INTRODUCTION - THE NEED TO REGULATE STORM WATER DISCHARGES

A. Impacts

The quality of storm water and urban runoff are fundamentally important to the health of the environment and the quality of life in Southern California. Polluted storm water runoff is a leading cause of water quality impairment in the Los Angeles Region. Storm water and urban runoff, during dry and wet weather, are often contaminated with pesticides, fertilizers, animal droppings, trash, food wastes, automotive byproducts, and many other toxic substances generated by our urban environment. Water that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas carries these untreated pollutants through the storm drain networks directly into the receiving waters of the Region. Several of the documented water quality impacts and increased public health risks from Municipal Separate Storm Sewer System (MS4) discharges that affect receiving waters nationwide and Los Angeles County and its coastline are listed below.

The **National Urban Runoff Program** (NURP) Study (USEPA 1983) showed that MS4 discharges draining from residential, commercial, and light industrial areas contain more than ten times the annual loading of total suspended solids. Although the NURP Study did not target industrial sites, the study suggested that runoff from industrial sites may have significantly higher contaminant levels than runoff from other urban land use sites. Several studies tend to support this suggestion, such as the Fresno, California NURP project, which showed that industrial areas had the poorest storm water quality of the four land-uses evaluated. The study also found that pollutant levels from illicit discharges were high enough to significantly degrade receiving water quality, and threaten aquatic life, wildlife, and human health.

The **1998 National Water Quality Inventory** (305(b) Report)[1] showed that urban runoff/storm sewer discharges affect 11% of rivers, 12% of lakes, and 28% of estuaries.

[1] *Quality of Our Nation's Waters: Summary of the National Water Quality Inventory 1998 Report to Congress* - USEPA 841-S-00-001 - June 2000; *Water Quality Conditions in the United States: Profile from the 1998 National Water Quality Inventory Report to Congress* - USEPA 841-F-00-006 - June 2000

The report states that there was an increase in the impairment of ocean shoreline due to urban runoff/storm sewers from 55% in 1996 to 63% in 1998. The report notes that urban runoff and storm sewer discharges are the leading source of pollution and the main factor in the degradation of surface water quality[1] in California's coastal waters, rivers and streams.

The Natural Resources Defense Council (NRDC) 1999 Report, **"Stormwater Strategies, Community Responses to Runoff Pollution"**[2] identifies two main causes of the storm water pollution problem in urban areas. Both components are directly related to development in urban and urbanizing areas:

1. Increased volume and velocity of surface runoff. There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.

2. The concentration of pollutants in the runoff. Certain activities, such as those from industrial sites, are large contributors of pollutant concentrations to the storm water system.

The report also identified several activities causing storm water pollution from urban areas, practices of homeowners, businesses, and government agencies.

More recent studies conducted by **United States Geological Service** (USGS)[3] confirms the link between urbanization and water quality impairments in urban watersheds due to contaminated storm water runoff.

Other studies proved a direct link between polluted urban runoff and adverse health effects to humans.[4]

B. Benefits of Permit Program Implementation

Implementation of the MS4 permit requirements should significantly reduce pollutants in urban storm water in a cost-effective manner. Implementation of Best Management Practices (BMPs) should also reduce pollutant discharges, and improve surface water quality. The expected benefits of implementing the minimum measures of an MS4 NPDES permit include:

- **Enhanced Aesthetic Value**: Storm water affects the appearance and quality of a water body, and the desirability of working, living, traveling, or owning property near that water body. Reducing storm water pollution will increase benefits as these water bodies recover and become more desirable.
- **Enhanced Opportunities for Boating**: reducing sediment and other pollutants, and increasing water clarity, which enhances the boating experience for users, offer additional benefits.

[3] *Water Quality in the Puget Sound Basin, Washington and British Columbia, 1996-98,*Circular 1216 - USGS 2000; *Water Quality in the Long Island-New Jersey Coastal Drainages, New Jersey and New York, 1996-98,* Circular 1201 - USGS 2000
[4] *An Epidimiological Study Of Possible Adverse Health Effects Of Swimming In Santa Monica Bay* - Haile, R. W. et al, Santa Monica Bay Restoration Project, 1996

- **Enhanced Commercial Fishing**: Important because commercial fisheries are a significant part of the nation's economy, and 28% of the estuaries in the 305(b) Report were impacted by storm water/urban runoff.
- **Enhanced Recreational and Subsistence Fishing**: Pollutants in storm water can eliminate or decrease the numbers, or size, of sport fish and shell fish in receiving waters.
- **Reduced Flood Damage**: Storm water runoff controls may mitigate flood damage by addressing problems due to the diversion of runoff, insufficient storage capacity, and reduced channel capacity from sedimentation.
- **Reduced Illness from Consuming Contaminated Seafood**: Storm water controls may reduce the presence of pathogens in seafood caught by commercial or recreational anglers.
- **Reduced Illness from Swimming in Contaminated Water**: Epidemiological studies indicate that swimmers in water contaminated by storm water runoff are more likely to experience illness than those who swim farther away from a storm water outfall.
- **Enhanced Opportunities for Non-contact Recreation**: Storm water controls reduce turbidity, odors, floating trash, and other pollutants, which then allow waters to be used as focal point for recreation, and enhance the experience of the users.
- **Drinking Water Benefits**: Pollutants from storm water runoff, such as solids, toxic pollutants, and bacteria may pose additional costs for treatment, or render the water unusable for drinking.
- **Water Storage Benefits**: Storm water is a major source of impairment for reservoirs. The heavy load of solids deposited by storm water runoff can lead to rapid sedimentation of reservoirs and the loss of needed water storage capacity.[1]

III. STATUTORY AND REGULATORY HISTORY OF THE STORM WATER PROGRAM

Over the past 29 years, water pollution control efforts have focused primarily on certain process water discharges from facilities such as factories and sewage treatment plants, with less emphasis on diffuse sources. The 1972 amendments to the federal Clean Water Act (CWA) prohibit the discharge of any pollutant to waters from a point source, unless a NPDES permit authorizes the discharge. Because the focus on reducing pollutants was centered on industrial and sewage treatment discharges, Congress amended the CWA in 1987, requiring the USEPA to create phased NPDES requirements for storm water discharges.

In response to the 1987 Amendments to the CWA, EPA developed Phase I of the NPDES Storm Water Program in 1990. Phase I requires NPDES permits for storm water discharges from: (i) "medium" and "large" MS4s generally serving, or located in incorporated places or counties with, populations of 100,000 or more people; and (ii) eleven categories of industrial activity, one of which is construction activity that disturbs five acres or greater of land.

Phase II, adopted in December 1990 and scheduled to be in full effect in March 2003, requires operators of small MS4s and small construction sites (construction activity disturbing between 1 and 5 acres of land) in urban areas to control storm water runoff discharges. Phase II establishes a cost-effective approach for reducing environmental harm caused by storm water discharges from previously unregulated diffuse sources.

[1] *Report to Congress on Phase II Storm Water Regulations.* USEPA, Office of Water. EPA-833-R-99-001, Oct. 1999.

A. Basis for Permit Conditions

1. **Statutory basis for permit conditions.** The conditions established by this permit are based on Section 402(p)(3)(B) of the CWA which mandates that a permit for discharges from MS4s must: effectively prohibit the discharges of non-storm water to the MS4; and require controls to reduce pollutants in discharges from MS4 to the maximum extent practicable (MEP) including best management practices, control techniques, and system, design and engineering methods, and such other provisions determined to be appropriate. MS4s are not exempted from compliance with Water Quality Standards. Section 301(b)(1)(C) of the CWA requiring that NPDES permits include limitations, including those necessary to meet water quality standards, applies. The intent of the permit conditions is to meet the statutory mandate of the CWA.

   As authorized by 40 CFR 122.44(k), the permit will be utilizing BMPs, a comprehensive Storm Water Quality Management Plan (SQMP), as the mechanism to implement statutory requirements. Section 402(p)(3)(B)(iii) of the CWA clearly includes structural controls as a component of maximum extent practicable requirement.

2. **Regulatory basis for permit conditions.** As a result of the statutory requirements of the CWA the USEPA promulgated the MS4 Permit application regulations, 40 CFR 122.26(d). These regulations described in detail the permit application requirements for MS4s operators. The information in the Report of Waste Discharge (ROWD) was utilized to develop the permit conditions and determine permittees status in relationship to these conditions.

3. **Discharge limitations.** No numeric limitations are proposed at this time. In accordance with 40 CFR 122.44(k), the USEPA has required a series of increasingly more effective BMPs[1], in the form of a comprehensive SQMP, performance standards, in lieu of numeric limitations.[2]

B. Public Review and Participation Process

Since the Regional Board received the ROWD for Los Angeles County on January 31, 2001, Regional Board staff has dedicated significant time and effort to the public review and participation process. Many meetings, workshops, and other outreach efforts were organized to ensure that the public, the Permittees, and other interested parties had ample opportunity to participate in the development and comment on draft permit requirements and language prior to the proposed adoption by the Regional Board.

To invite public comment at the beginning of the renewal process, a preliminary draft, dated March 16, 2001, was issued to a working group of interested parties. This draft was used as a starting point for discussion. Recipients had approximately 30 days to review it prior to the issuance of the first draft, on April 13, 2001. The first draft was sent to all Permittees, storm water consultants, environmental organizations, and other

[1] *Interpretative Policy Memorandum on Reapplication Requirements* of MS4s issued by USEPA (61 Fed. Reg. 41697)
[2] *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits* (61 Fed. Reg. 43761)

interested parties. It was also available on the Regional Board Storm Water web page at www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html. Again, more than one month was provided for the submittal of written comments. The renewal schedule also included the issuance of a second draft, followed by over 30 days for review and comments, and an additional 45 days between the issuance of the final draft and the proposed permit adoption, on October 25, 2001.

Furthermore, Regional Board staff conducted separate meetings to discuss each individual Special Provision as necessary. In addition to these meetings, Regional Board staff held two workshops to review the permit and listen to comments, including one formal workshop with the Board members. Regional Board staff also participated in the monthly Executive Advisory Committee meetings to answer questions and discuss permit issues. Staff was also available for public outreach via telephone. The following table outlines the public review process.

Date	Public Involvement Activity
January 31, 2001	Application for permit renewal (ROWD)
February 27, 2001	Inspections Working Group Meeting
February 28, 2001	Illicit Connection/Discharge Working Group Meeting
March 1, 2001	Monitoring Working Group Meeting
March 12, 2001	Public Information and Participation Working Group Meeting
March 20, 2001	Inspections Working Group Meeting
March 20, 2001	Construction Working Group Meeting
March 22, 2001	Preliminary Draft Working Group Meeting
April 9, 2001	Monitoring Working Group Meeting
April 13, 2001	Issuance of First Draft
April 24, 2001	Public Workshop
April 24, 2001	Construction Meeting with Building Industry Association
April 27, 2001	Monitoring Working Group Meeting
May 9, 2001	Monitoring Working Group Meeting
May 16, 2001	First Draft Comments Due
May 24, 2001	Construction Meeting with BIA
June 4, 2001	Monitoring Working Group Meeting
June 14, 2001	Monitoring Station Identification Field Trip
June 25, 2001	Monitoring Working Group Meeting
June 29, 2001	Issuance of Second Draft
July 26, 2001	Formal Workshop with Regional Board
September 7, 2001	Issue Final Draft
October 25, 2001	Proposed Permit Adoption at Board Meeting

IV. BACKGROUND - LOS ANGELES COUNTY MS4

A. Los Angeles County MS4 Permit History

In 1990, the Los Angeles Regional Water Quality Control Board (Regional Board) adopted Order No. 90-079, the Los Angeles County Municipal Storm Water Permit. That permit required the County of Los Angeles and the incorporated cities to implement pollution controls including amending ordinances, optimizing existing pollutant controls such as street sweeping, construction site controls, and others. The 1990 permit also required all Permittees to implement a minimum 13 BMPs for consistency across the County. The 1990 permit was issued on a system wide basis due to the highly interconnected storm drain system serving a population well in excess of 100,000 inhabitants. An NPDES permit is valid for a five-year period after the date is issued[1].

On July 15, 1996, the Regional Board adopted Order No. 96-054 that revised the 1990 permit. The 1996 permit required model programs be developed and implemented by the Permittees for Public Information and Public Participation, Industrial/Commercial Activities, Development Construction, Illicit Connections and Illicit Discharges, Public Agency Activities, and Development Planning. These dynamic model programs are modified with the changing needs of the SQMP.

Following the adoption of Order 96-054, the City of Long Beach submitted a ROWD as an application for its own MS4 permit. The City of Long Beach Municipal Storm Water Permit (Order No. 99-060) was adopted on June 30, 1999. This Order superseded the countywide permit, allowing Long Beach to operate under separate waste discharge requirements.

On January 31, 2001, the Los Angeles County Department of Public Works submitted an application for renewal of their MS4 permit in the form of an ROWD for Los Angeles County and the incorporated cities, except for the City of Long Beach. This application started the process of renewing the permit, which enters in its third cycle since the initial one was adopted in 1990.

B. Los Angeles County Storm Drain System

The storm drain system covered by this proposed permit for the County of Los Angeles and 83 incorporated cities drains the coastal slopes of the Transverse Mountain Ranges, and flows into the Santa Monica Bay and the Los Angeles/Long Beach Harbor. The storm drain structure consists of thousands of catch basins, thousands of miles of underground storm drains, as well as open channels, all owned and operated separately by Permittees. The length of the system, and the locations of all storm drain connections, is not known, as a comprehensive map for the storm drain system does not exist. Rough estimates, based on information from large municipalities (population > 100,000), indicates that the length exceeds 4,300 miles, as shown below.

[1] 40 CFR §122.46 (a)

Permittee	Area (Square Miles)	Catch Basins	Storm Drain Length	Open Channel Length
LA County		73,000	2,650 miles	450 miles
City of LA	469	30,000	1,600 miles	31 miles
El Monte	10	316	11 miles	0.4 mile
Glendale	30.6	1,100	Unknown	Unknown
Inglewood	9	1,157	12 miles	
Pasadena	26	1,050	30	
Santa Monica	8.3	850		
Torrance	20	2,000	20 miles	3 miles
TOTAL		**109,473**	**4,323**	**484.4**

C. Summary of Problems in the Los Angeles County Watersheds

Watersheds are geographic areas draining into a river system, ocean or other body of water through a single outlet. There are five Watershed Management Areas (WMAs) that represent the five major watersheds covered by the Los Angeles County MS4 NPDES permit. The following is a summary of some significant issues in each watershed.[1]

Dominguez Channel/Los Angeles-Long Beach Harbor Watershed

Permitted discharges

- 415 dischargers covered under an industrial storm water permit
- 69 dischargers covered under a construction storm water permit

Potential sources of pollution

- Historical deposits of DDT and PCBs in sediment
- Spills from ships and industrial facilities
- Leakages contaminating groundwater
- **Urban and storm water runoff**
- Impairments: metals, PCBs, PAHs, historic pesticides, coliform, trash, and nitrogen

Los Angeles River Watershed

Permitted discharges

- 1,327 dischargers covered under an industrial storm water permit

[1] *Watershed Management Initiative Chapter.* California Regional Water Quality Control Board – Los Angeles Region. Dec. 2000.

- 147 dischargers covered under a construction storm water permit

Potential sources of pollution

- Nitrogen and coliform contributions from septic systems
- Other nonpoint sources (horse stables, golf courses)
- Leakage of MTBE from underground storage tanks
- **Urban and storm water runoff**
- Impairments: nitrogen, trash, selenium, other metals, coliform, PCBs, historic pesticides, chlorpyrifos

San Gabriel River Watershed[1]

Permitted discharges

- 549 dischargers covered under an industrial storm water permit
- 175 dischargers covered under a construction storm water permit

Potential sources of pollution

- Excessive trash in recreational areas of upper watershed
- Nonpoint source loadings from nurseries and horse stables
- **Urban and storm water runoff**
- Impairments: nitrogen and effects, trash, metals, historic pesticides, coliform, chlorides, and PCBs

Santa Monica Bay Watershed

- 549 dischargers covered under an industrial storm water permit
- 175 dischargers covered under a construction storm water permit

Potential sources of pollution

- Discharges from Ballona and Malibu Creeks contribute to impairments in the Santa Monica Bay and its beaches.
- Impairments: mercury, selenium, other metals, historical pesticides, PAHs, PCBs, nitrogen, coliform, trash, TBT, habitat alteration, exotic vegetation, and salts

Coastline

- **Acute health risk associated with swimming in runoff contaminated surfzone waters**
- Chronic risk associated with consuming seafood from areas impacted by DDT and PCB contamination
- Historic deposits of DDT and PCBs in sediment

Ballona Creek Watershed

- Trash loading from creek

[1] *San Gabriel Watershed State of The Watershed* - RWQCB - LA Region - June 2000

- Sediment contamination by heavy metals form creek to Marina del Rey Harbor and offshore
- **Toxicity of both dry weather and storm water runoff in creek**
- High bacterial indicators at mouth of creek

Malibu Creek Watershed

- Excessive freshwater, nutrients, and coliform in lagoon; contribution from POTW and other sources
- **Urban runoff from upper watershed**
- Septic tanks in lower watershed

V. DISCUSSION OF SPECIAL PROVISIONS

A. Public Information and Participation Program (PIPP)

Legal Authority:

CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(I)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) provides that the proposed management program include "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from MS4s associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(6) provides that the proposed management program include " A description of education activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."

To satisfy the Public Education and Outreach minimum control measure, the Permittees need to: (i) implement a public education program to distribute educational materials to the community, or conduct equivalent outreach activities about the impacts of storm water discharges on local waterbodies and the steps that can be taken to reduce storm water pollution; and (ii) determine the appropriate BMPs and measurable goals for this minimum control measure.

Background:

Implementation of a PIPP is a critical BMP and a necessary component of a storm water management program. The State Board Technical Advisory Committee "recognizes that education with an emphasis on pollution prevention is the fundamental basis for solving nonpoint source pollution problems." The USEPA Phase II Fact Sheet 2.3 (Fact Sheet 2.3) finds that "An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the

public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters."[1]

Furthermore, the public can provide valuable input and assistance to a municipal storm water management program and, therefore, should play an active role in the development and implementation of the program. An active and involved community is essential to the success of a storm water management program because it allows for:

- Broader public support since citizens who participate in the development and decision making process are partially responsible for the program and, therefore, may be less likely to raise legal challenges to the program and are more likely to take an active role in its implementation;
- Shorter implementation schedules due to fewer obstacles in the form of public and legal challenges and increased sources in the form of citizen volunteers;
- A broader base of expertise and economic benefits since the community can be a valuable, and free, intellectual resource; and
- A conduit to other programs as citizens involved in the storm water program development process provides important cross-connections and relationships with other community and government programs. This benefit is particularly valuable when trying to implement a storm water program on a watershed basis, which is encouraged by the USEPA.

Discussion:

Based on the background information, the County should continue its comprehensive educational storm water and urban runoff outreach program, which is designed to measurably increase public knowledge and change behavior regarding storm water pollution. The first five-year public education plan was successful at studying segmentations of Los Angeles County residents to identify those who pose the greatest threat to storm water quality and those who represent the greatest opportunity to respond to a public education program, as well as providing a baseline measurement of residents' storm water-related practices and habits. This information was used to target the residents who are most likely to change their behaviors to improve storm water quality. Using various communication tactics and activities, the program successfully reached 83% of County residents with pollution prevention messages through the Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis (Five-Year Strategy).[2]

Although the Program has been successful at certain goals it must be augmented to continue increasing public awareness of specific storm water issues. According to the USEPA, materials and activities should be relevant to local situations and issues, and incorporate a variety of strategies to ensure maximum coverage. This is addressed in Part P.4 of the Five-Year Strategy by

[1] *Storm Water Phase II Final Rule - Public Education and Outreach Minimum Control Measure*. USEPA Fact Sheet 2.3, January 2000.

[2] *Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis*, Los Angeles County of Public Works, July 31, 2000.

requiring the development of watershed and pollutant-specific education programs.

Also, the USEPA encourages partnerships and cooperation, and quarterly meetings will provide the opportunity for Permittees to coordinate their outreach efforts and efficiently build on the County's existing program with local, watershed-specific efforts.

Furthermore, "Directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts is recommended" (Fact Sheet 2.3). The Permittee conducted educational site visits to Phase I industrial facilities, auto repair shops, retail gasoline outlets, and restaurants during the last 5-year permit cycle. The next step in this targeted outreach program is education at the corporate level to facilitate employee compliance, as described in Part P.5 of Five-Year Strategy. Also, a non-regulatory business assistance program will encourage small businesses that lack access to the expertise necessary to comply with storm water regulations to implement pollution prevention measures.

Specific significant changes in the draft permit and their justifications are described below:

1. Program for Residents

NEW REQUIREMENT: The Principal Permittee shall organize Public Outreach Strategy meetings with all Co-permittees on a quarterly basis. The Principal Permittee shall provide guidance for Co-permittees to augment the regional outreach and education program. Co-permittees shall coordinate regional and local outreach and education to reduce duplication of efforts.

JUSTIFICATION: This requirement is based on the need for coordination between all Permittees. Since the Program's inception, Permittees have been required to conduct education activities within their own jurisdictions. The lack of guidance and coordination has led to duplicate efforts and confusion about developing appropriate programs that are consistent with, and enhance, the Principal Permittee's regional education program. This requirement will ensure that all Permittees are coordinated for the most efficient and effective Program. It will also help identify Permittees with insufficient Programs.

Fact Sheet 2.3 states that it is generally more cost-effective to have numerous operators coordinate to use an existing program than all developing their own local programs. Therefore, Permittees should build on the regional program with additional information specific to local needs.

NEW REQUIREMENT: The Principal Permittee and Co-permittees shall coordinate to develop outreach programs that target the watershed-specific pollutants listed in Table 1 within 6 months of the permit adoption date. It may be appropriate to address metals in the Industrial/Commercial businesses program. Region-wide pollutants may be included in the Principal Permittee's mass media efforts.

Table 1. Target Pollutants for Outreach

Watershed	Target Pollutants for Outreach
Ballona Creek	*Trash, Indicator Bacteria, Metals, PAHs*
Malibu Creek	*Trash, Nutrients (Nitrogen), Indicator Bacteria*
Los Angeles River	*Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs*
San Gabriel River	*Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals*
Santa Clara River	*Nutrients (Nitrogen), Indicator Bacteria*
Dominguez Channel	*Trash, Indicator Bacteria, PAHs*

JUSTIFICATION: This requirement will allow the Program and/or local efforts to focus on target pollutants. Citizens must be aware of priority pollutants and their causes for any improvement to occur. Page 3 of the SQMP states that the components within the phases that roll-out over the next four years will be fluid to reflect the evolving message for each targeted audience. This implies that the Permittee realizes the need to target pollutants and specific audiences and has already planned to address this issue. This is a necessary step in the implementation of current and future total maximum daily loads (TMDLs) requirements.

Fact Sheet 2.3 states that municipalities should strive to make their materials and activities relevant to local situations and issues, and to incorporate a variety of strategies to ensure maximum coverage. It also recommends directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts.

Although it may not be appropriate to target heavy metals through the Program for Residents, it may be accomplished through the site inspection program. The Industrial/Commercial Program will prioritize facilities by their threat to water quality and whether or not they generate pollutants for which the water body is impaired, so it will be consistent with this requirement and Table 1.

2. Programs for Businesses

NEW REQUIREMENT: The Principal Permittee shall develop and implement a Corporate Outreach Program to educate corporate environmental managers about storm water regulations. The Program shall target retail gasoline outlets (gas stations) and restaurant chains.

JUSTIFICATION: Facility owners and representatives at the corporate level are not typically present during site visits or inspections. They need to be educated about applicable storm water regulations so they can set rules and direct management to ensure compliance at the facility level.

This has already been discussed as the next step following the last five years of outreach to these businesses.

NEW REQUIREMENT: Permittees may develop and implement a Business Assistance Program to provide technical resource assistance to small businesses to help them understand and comply with storm water regulations.

JUSTIFICATION: Many small businesses do not have the resources or expertise necessary to understand and implement storm water regulations. And hiring consultants and implementing structural BMPs can put many small operators out of business. Therefore, a non-regulatory assistance program that educates businesses about pollution prevention will help them comply, and cut costs, so they can continue to be competitive. This is encouraged, but is not a requirement.

The City of Los Angeles has been implementing a successful business outreach program through the Hazardous and Toxic Materials Office since 1988.

Fact Sheet 2.3 recommends directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts.

Alternative funding sources, such as grants and loans may be available to fund such a program.

3. Performance Standards

NEW PERFORMANCE STANDARD: The discharger shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water via print, local TV access, local radio, or other appropriate media.

JUSTIFICATION: According to the Principal Permittee's Year Four (1999-2000) Highlights, approximately 85 million impressions were made through advertising, media relations, customized coffee jackets, corporate partnerships, special events, and business outreach. Hits on the www.888CleanLA.com website have been consistently increasing, indicating a growing public interest, as well as greater impressions. It can be anticipated that mass media coverage will become more efficient after the final Program study is complete in the summer of 2001. Also, increased media attention and public interest in current issues, such as trash TMDLs, is expected. The County originally proposed that it would make a minimum of 50 million impressions per year; however, this number has been reduced to 35 due to the increasing cost of advertising.

The requirement is consistent with the number of impressions required in the City of Long Beach Municipal Storm Water Permit Order (99-060) and the Ventura County Municipal Storm Water Permit. The City of Long Beach is required to make a minimum of 1.5 million impressions per year. With a total population of approximately 426, 000 people, they must impress each person approximately 3.5 times per year. Ventura County is also required to impress every resident approximately 3 times. The 9.5 million people in Los Angeles County[1] must be impressed approximately 3 times per year.

[1] 2000 U.S. Census Bureau

NEW PERFORMANCE STANDARD: The discharger shall provide all School Districts within its jurisdiction with materials, including videos, live presentations, brochures, and other media necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution. All Co-permittees shall cooperate with funding and implementing this requirement. Cooperative efforts with other agencies may also be used to accomplish this requirement.

JUSTIFICATION: This requirement is consistent with the City of Long Beach Municipal Storm Water Permit.

It is also justified by the performance of Los Angeles County's School Environmental Education Program. According to data provided by the County, the Program has been reaching approximately 50 percent of elementary and secondary schools in the County every 2 years. It is also expected that the required coordination among permittees will increase the effectiveness and range of this Program.

NEW PERFORMANCE STANDARD: Corporate Outreach for all gas station and restaurant chain corporations shall occur once every 2 years, not less than twice during the permit cycle.

JUSTIFICATION: This performance standard is required because it is consistent with the frequency of previous and current inspections. This program will replace the need for educational site visits or inspections of gas stations. The resources saved by not inspecting gas stations can be used to fund this program. Also, a corporation can encompass many gas stations or restaurants, so the number of consultations will be significantly less than that of previously required educational site visits.

B. Industrial/Commercial Facilities Program

Legal Authority:

The Phase I 40 CFR 122.26(d)(2) regulations require, in part, that the applicant (i) develop adequate legal authority, (ii) perform a source identification, and (iv) develop a management program to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system design and engineering methods, and such other provisions which are appropriate. Specifically, with regards to industrial controls, the management plan shall include the following.

40 CFR 122.26(d)(2)(iv)(C), A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and **industrial facilities** that the municipal permit applicant determines are **contributing a substantial pollutant loading to the municipal storm sewer system**. The program shall:

*(1) Identify priorities and procedures for **inspections** and **establishing and implementing control measures** for such discharges;*

*(2) Describe a **monitoring program** for storm water discharges associated with industrial facilities [...]*

Background:

The municipality is ultimately responsible for discharges from their municipal storm sewer system (MS4). Because industrial awareness of the program may not be complete, there may be facilities within the MS4 area that should be permitted but are not (non-filers). In addition, the Phase I regulations that require industries to obtain permits is based on SIC Code. This has been shown to be incomprehensive in identifying industries that may be significant sources of storm water pollution (*by industries we also mean commercial businesses. "Industries" is intended as a generic term*) that should be permitted. Another concern is that the permitting authority **may not have adequate resources** to provide the **necessary oversight** of permitted facilities. Therefore, it is in the municipality's best interest to assess the specific situation and implement an industrial/commercial inspection/site visit and enforcement program to control the contribution of pollutants to and through their MS4 to the maximum extent practicable from all high risk sources.

In the preamble for its 1990 regulations, the USEPA clearly states the intended strategy for discharges of storm water associated with industrial activity: *"...Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that **controls** be placed on **storm water discharges associated with industrial activity** which discharge through the municipal system."* The USEPA also notes in the preamble that *"... municipalities will be required to meet the terms of their permits related to industrial dischargers."*

In the Chapter 3.0 of the USEPA's Guidance Manual[1], it is specified that municipal applicants must demonstrate that they possess adequate legal authority to:

- Control construction site and other **industrial discharges** to MS4s;
- Prohibit illicit discharges and control spills and dumping;
- Carry out **inspection, surveillance, and monitoring** procedures.[1]

The document goes on to explain that **"control"**, in this context means not only to require disclosure of information, but also to **limit, discourage, or terminate** a storm water discharge to the MS4. Also, to satisfy its permit conditions, a municipality **may need to impose additional requirements on discharges from permitted industrial facilities, as well as discharges from industrial facilities and construction sites *not* required to obtain permits.**

In the same Guidance Manual, Chapter 6.3.3, it is stated that the municipality is ultimately responsible for discharges from their MS4. Consequently, the proposed storm water management program should describe how the municipality **will help** the USEPA and authorized NPDES States to:

- **Identify** priority industries discharging to their systems; **R0003080**

[1] *Guidance Manual For the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems* - USEPA -November 1992

- **Review and evaluate** storm water pollution prevention plans (SWPPPs) and other procedures that industrial facilities must develop under general or individual permits;
- **Establish and implement** BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- **Inspect and monitor** industrial facilities discharging storm water to the municipal systems to ensure these facilities are in compliance with their NPDES storm water permit, if required.

Discussion:

Recognizing that the municipality is ultimately responsible for the quality of storm water discharges in the MS4, the municipalities should evaluate the industrial/commercial facilities and determine their compliance with the permit requirements, as well as their contribution to the MS4 and potential impacts to the receiving waters. The following areas must be addressed in order to implement a meaningful industrial/commercial inspection/site visit and enforcement program, which has the ability to **control and reduce** the contribution of pollutants from industrial/commercial sites to the MEP.

- **Source Identification**
  - Identification of industrial/commercial sites discharging to the MS4 (by SIC codes and narrative if needed)
  - Characterization of activities, materials used, and potential for contributing pollutants along with the type of pollutants

- **Pollution Prevention**
  - Key concepts are many times overlooked: **Prevent, before it happens**, and be **Pro-active** rather than **Reactive**. It is more difficult to treat after the pollutant is released or mixed with runoff. BMPs and other site-specific controls are often most appropriate for reducing pollutants in storm water discharges associated with industrial activity.

- **Threat to Water Quality Prioritization**
  - Identify impaired water bodies and link with activities and industrial/commercial sites that may contribute specific pollutants creating (or potentially contributing to) the water quality impairment

- **Through existing ordinance, order, or similar means, the ability to**
  - enter premises;
  - conduct inspections;
  - review and evaluate SWPPPs;
  - require minimum BMP implementation and monitoring results review; and,
  - take appropriate enforcement procedures and actions

  in order to address the following elements:

  - minimum BMP Implementation
  - monitoring of Industrial/Commercial sites
  - inspection/site visit of Industrial/Commercial sites
  - enforcement measures for Industrial/Commercial sites

It may be necessary to update existing ordinances if they do not provide sufficient legal authority to implement the above mentioned components.

Strategy and Coordination with State activities

Recognizing the dual coverage envisioned by the USEPA regulations, and suggested partnership between local and State authorities, municipalities shall coordinate with State activities for the implementation of the General Industrial Activities Storm Water Permit (GIASP) and the control of other sources not specifically covered under Phase I storm water regulations but identified as significant contributors of pollutants by the municipalities through their identification and prioritization process. The net result should be a better and improved coordinated program with greater impact on limiting and eliminating (as a final goal) the contribution of pollutants to the receiving water while maintaining and/or restore the capacity of the receiving water to sustain the beneficial uses without impairments.

During the previous permit cycle the Los Angeles County conducted a Critical Source Study (1998-2000) as required by the permit conditions. The objective of the study was to identify five priority industrial and/or commercial critical source types, and monitor each source type for two years. The *Critical Source Selection and Monitoring Report* (Woodward-Clyde, 1997) identified as the five highest ranked pollution potential activities to be, in order of ranking: (i) wholesale trade (scrap, auto dismantling), (ii) automotive repair/parking, (iii) fabricated metal products, (iv) motor freight (including trucking), (v) chemical and allied products. The report also outlined a complete study plan to be implemented by the Permittees during the permit cycle. It is significant to note that four out of five categories of activities are subject to Phase I storm water regulations while automotive repair/parking category was not the focus of Phase I, but the study identified this category as a significant contributor based on the criteria developed in the report.

Rank (pollution potential)[1]	Industrial Category	SIC Code	No. Facilities
1	Wholesale trade (scrap, auto dismantling)	50	587
2	Automotive repair/parking	75	6,067
3	Fabricated metal products	34	3,283
4	Motor freight (including trucking)	42	872
5	Chemical and allied products	28	1,069

Based on the dual coverage and partnership approach between permitting authority and municipalities intended by the USEPA in the storm water regulations (see letters from Alexis Strauss, USEPA Water Division Director)[2,3], and in order to best use limited resources at the State and Municipal level, Regional Board staff requires the following improvements:

Recognizing that this permit represents a third generation permit, and building upon the experience and tools developed under the previous permits, the Industrial/Commercial program must be elevated to an Inspection/Site visits and

[1] *Critical Source Selection and Monitoring Report (Table 1-3)* - Woodward-Clyde 1996
[2] Letter dated December 19, 2000, from Alexis Strauss, Director, Water Division, USEPA Region IX, to Dennis Dickerson, Executive Officer, Regional Water Quality Control Board-Los Angeles Region.
[3] Letter dated April 30, 2001, from Alexis Strauss, Director, Water Division, USEPA Region IX, to Honorable Stephen Horn, U.S. House of Representatives

enforcement program, in order to have the municipalities control the storm water discharges associated with industrial activities from industrial/commercial facilities to the MEP while assisting the Regional Board to implement the general permit for industrial activities. The business PIPP component should be continued under the auspices of the Public Education program.

The strategy as outlined in the permit builds on the State/Municipalities partnership by focusing their limited resources on the following activities:

- The Permittees will take a lead role in inspecting restaurants, automotive service facilities and site visits at Phase I facilities while
- Regional Board will be the lead for facilities covered or in need of coverage under GIASP
- The Permittees will assist Regional Board in its activities to fully implement the GIASP through spot check inspections, referrals, data information search, joint inspections
- The Regional Board and Permittees will coordinate their informational systems and task scheduling to avoid duplication and strengthen harmonization of activities

C. Construction Sites Program

Legal Authority:

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D) provides that a proposed management program must include "A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system."

In this Permit renewal, Regional Board staff have drafted language that provides more consistency among the Permittees and that distinguishes among the different types and sizes of construction activity that occur within our Region.

Background:

There are different environmental impacts of construction activity.

As stated in the *California Storm Water Best Management Practice Handbook for Construction Activity* (BMP Handbook), "Construction usually increases the amount of impervious area causing more of the rainfall to runoff, and increasing the speed at which runoff occurs. Unless properly managed, this increased runoff will erode natural and/or unprotected watercourses causing the watercourse to widen...Sedimentation can also contribute to accelerated filling of reservoirs, harbors, and drainage systems.[1]

Discussion:

R0003083

The prevention of erosion is a key objective to the proposed modifications to the construction program under this draft Order. The Permittees currently oversee

[1] *California Storm Water Best Management Practice Handbook for Construction Activity*. 1993

construction sites within their respective jurisdiction. The oversight of smaller construction sites (those sites under five acres) is inconsistent among Permittees. Some Permittees have incorrectly assumed that responsibility begins only after a discharge of pollutants, sediments for example, has left the site. This was not intended in either the Phase I Federal Regulations promulgated on November 16, 1990, or in Board Order 96-054. In this permit reissuance, Regional Board staff proposes to eliminate these inconsistencies and require that the municipalities better coordinate oversight of construction activity within their jurisdiction. The Permittees are ultimately responsible for what enters and exits the portion of the storm drain system that they own and/or operate. It is in the best interest of the Permittees to become familiar with what enters their system and to control as necessary the discharges allowed into their storm drain system.

Specific significant changes in the draft permit and their justifications are described below:

NEW REQUIREMENT: Regional Board staff propose that the Permittees implement requirements for the use of effective erosion and sediment controls at construction sites regardless of size, wherever applicable.

JUSTIFICATION: The need for proper erosion and sediment controls is very apparent during, and immediately after, the rains that we experience in Southern California. The environmental effects of erosion are well documented and erosion is something that can be prevented or reduced with the proper foresight and implementation of suitable BMPs.

NEW REQUIREMENT: Requirements for structural source control and non-structural BMPs for controlling runoff at construction sites.

JUSTIFICATION: The need to properly control runoff at construction sites is great. When erosion occurs the sediments generated begin to flow down hill. With adequately engineered and implemented structural or non-structural BMPs, the detrimental environmental effects can be eliminated or minimized. Currently, there are many manuals and guidance handbooks available to lead a developer. The municipalities, in general, are aware of these BMPs, and working with Regional Board staff facilitates the requirements being quickly implemented.

NEW REQUIREMENT: Each Permittee shall require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP), or compliance with a minimum set of BMPs for construction sites of less than 1 acre.

JUSTIFICATION: This requirement is intended to bring the smaller sites into environmental compliance by requiring the implementation of erosion and sediment control or pollution prevention BMPs on smaller sites that other wise would potentially not have any requirements for pollution control. This, however, does not necessarily require that a permit be issued to the small site operator.

NEW REQUIREMENT: Each Permittee shall require the preparation, submittal, and implementation of a Local SWPPP prior to issuance of a grading permit for construction projects that meet one or more of the following criteria: will result in soil disturbance of one acre or more in size; is within, directly adjacent to, or is

discharging directly to an environmentally sensitive area; or is located in a hillside area.

JUSTIFICATION: This is to ensure that a site that is being graded, but is less than the size requirements for a General Construction Activities Storm Water Permit (GCASP) have oversight by the local permitting authority. Currently, there are inconsistent requirements for grading among the Permittees and this change would bring consistency and environmental protection for smaller sites conducting grading activities.

NEW REQUIREMENT: The Permittees shall have a mechanism to review, approve, and enforce any erosion control plan submitted to the Permittee for implementation at construction sites within the legal boundary of the Permittees jurisdiction, regardless of size and regardless of whether a GCASP exists for the sites. This mechanism shall be available through the requirement of Local SWPPPs on projects within the Permittees jurisdiction of one acre or more.

JUSTIFICATION: The Permittees need to take an active role in what the operators of construction sites are doing to prevent erosion and not wait for the detrimental effects of a rain on a site with inadequate erosion controls and the flow of sediments off site to react with an enforcement action.

NEW REQUIREMENT: The Permittees, on those sites that need a GCASP shall not issue a grading permit until such time that the Notice of Intent (NOI) to comply with the State Permit and a copy of the SWPPP is submitted to the local authority. This also applies to property transfers between developers.

JUSTIFICATION: This is currently a requirement in Board Order No. 96-054, but not all Permittees have completely or consistently implemented this. Regional Board staff inspect construction sites covered by a GCASP. The Permittees are optimizing the implementation of the State Permit when they implement this requirement. Regional Board staff has found that on occasion, a Permittee issues a grading permit where no state permit has been obtained. State-municipal coordination reduces the amount of sites that Regional Board staff inspects for State requirements. With this requirement fully implemented, Regional Board staff believe that the number of construction sites covered by a State Permit will increase from approximately 1000 to 1500, solely as a result of consistency among the Permittees in issuing grading permits.

NEW REQUIREMENT: Wet weather inspections are required of all construction sites one acre or greater. The Permittees need to conduct wet weather inspections to ensure compliance with local ordinances.

JUSTIFICATION: If all sites are inspected, this allows the Permittees to ascertain compliance and focus educational and enforcement efforts on those that most need it. Additionally, Regional Board staff can assist the Permittees in compliance oversight by conducting joint inspections. The City of Los Angeles estimates that there will be an increase of 15,000 sites. As this is the largest Permittee it is anticipated that this new requirement will not be as burdensome on the rest of the Permittees. Nonetheless, these inspections will be essential to reducing the discharge of pollutants to waters of the United States to the maximum extent practicable.

D. Illicit Connections and Illicit Discharges Elimination Program

Legal Authority:

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) provides that the proposed management program "shall be based on a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) provides that the Copermittee include in its proposed management program "a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system."

Background:

During dry weather, much of the discharge to storm drain systems consists of wastes and wastewater from non-storm water sources. A significant amount of such discharges may be from illicit discharges or connections, or both. Illicit discharges may occur either through direct connections, such as deliberate or mistaken piping, or through indirect connections, such as dumping, spillage, subsurface infiltration, and washdowns.

The objective of a municipality's illicit connection/illicit discharge (IC/ID) elimination program should be to detect illicit connections and illicit discharges to the storm drain system, and to promptly eliminate such discharges and connections. Municipalities typically employ the approaches listed below to achieve this objective:

1. Mapping locations of outfalls of the MS4 and the names and locations of all waters of the U.S. that receive discharges from the outfalls.
2. Adopting a storm water/ urban runoff ordinance to prohibit unauthorized non-storm water discharges into the MS4, and implementing appropriate enforcement procedures and actions.
3. Implementing a program to detect and eliminate non-storm water discharges to the MS4, including illegal dumping.
4. Educating public employees, businesses, and the general public about the dangers associated with illegal discharges and improper disposal.
5. Establishing a public reporting hotline or other mechanism to report illicit discharges and illegal dumping.
6. Establishing measurable goals to evaluate successful program implementation.

Discussion:

Existing IC/ID Elimination Program

The Regional Board approved a model IC/ID elimination program for the Permittees' SQMP on March 23, 1999. Only vague performance standards are specified in this model program. By July 1999, all Permittees reported that they implemented this program. Permittees' estimates of fiscal resources required to implement their programs ranged widely, with two cities, Culver City and Hermosa Beach, estimating expenditures of $4.2 million and $2.8 million, respectively. At the other end, four cities estimated $0 expenditures, namely La Habra Heights, Lawndale, Maywood (which does not operate a storm drain system), and West Covina. Based on the Permittees' estimates of expenditures, the Permittees expended an average of $113,900 in 1999/00. Removing the anomalous estimates for Culver City and Hermosa Beach, the high ranges up to $564,809, as estimated by the City of Los Angeles, and averaged $32,500.

The Permittee's IC/ID activities are summarized in Tables 1 through 12. The reports of suspected illicit discharges and connections, as summarized in the tables, do not appear to bear a relationship with IC/ID expenditures by each Permittee.

Illicit Connections: As designed in the model program, Permittees with storm drain systems under their management rely upon field screening, during regularly scheduled maintenance of the storm drain system, to locate illicit connections. However, most Permittees cannot estimate the length of the storm drain system that was field-screened; nor did the Regional Board require reporting such information.

For the 1999/00 annual reporting period, very few Permittees reported illicit connections. The attached tables show that the numbers of illicit connections varied widely among Permittees, with about half reporting no illicit connections, and with the County reporting 877 suspected illicit connections. Part of the reason for this range is that the County is responsible for maintaining over half[1] of the storm drain system. Also, several Permittees believe that few – if any – illicit connections have been identified in many cities because: (a) many cities are primarily residential, and illicit connections are unlikely to occur from residential land use; and (b) cities in the County of Los Angeles are relatively new vis a vis their eastern counterparts, and adequate controls were in place at the time storm drain connections were installed.

Illicit Discharges: As designed in the model program, Permittees eliminate illicit discharges by preventing spills and, for those that do occur, by responding promptly. To prevent spills, Permittees enacted ordinances prohibiting non-storm water runoff, and are following spill prevention guidance. To respond to discharges, Permittees implement containment and cleanup procedures, coordinate with other agencies, investigate the cause of the discharge and – when the source and responsible party is know – take enforcement action. Additionally, employee training is provided on all of the above.

As with illicit connections, the numbers of illicit discharges varies widely for the annual reporting period 1999/00. The County reported a total of 788 suspected illicit discharges. Among the Cities, results at the high end include 1,876 in the

City of Los Angeles, 700 in the City of Beverly Hills, and 450 in Santa Monica. At the other end of the range, many cities reported no incidents of suspected illicit discharges. Based on information provided to date, staff cannot account for this wide range. Audits of the Permittees' programs should help clarify this.

Reporting: As designed in the model program, Permittees have implemented procedures to receive reports of illicit discharge and disposal incidents, and to promptly respond and report such incidents. Most rely upon the countywide hotline system, which is maintained by the County. For hazardous substances, Permittees implement additional reporting procedures.

Proposed IC/ID Elimination Program

The Special Provisions Section of the proposed permit requires the Permittees to revise their IC/ID Elimination Program in the SQMP within 180 days of adoption. As specified in the proposed permit, the key revision to the IC/ID Elimination Program shall include a proactive screening program for illicit discharges in priority areas. As Permittees have pointed out, and as staff acknowledges, residential land uses are less likely to have illicit connections. However, staff remains concerned that adequate controls have been in place at all times for proper connections to the storm drain system. Staff's concern is based upon the wide range of illicit connections reported by Permittees with no apparent relation to land use, and also incidents of illicit connections reported separately to the Regional Board. Accordingly, the proposed permit specifies that the Permittees shall revise the SQMP to evaluate illicit connections, prioritize suspected problem areas, and implement a proactive field screening program for such areas (that does not rely upon screening during Permittees' regularly scheduled maintenance of the storm drain system). As set forth on page 3-3 and in Appendix I of the Permittees' model program, screening tools for the proactive program will include dye tests, smoke tests, and TV inspections.

E. Public Agency Activities Program

Legal Authority:

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A)(1,3,4,5,and 6). Each Copermittee must develop a program to reduce the discharge of pollutants to and from the MS4 to the maximum extent practicable for all urban land uses and activities, including municipal areas and activities.

Background:

Many Permittees conduct activities that ultimately result in the enhancement of the lives of the residents of the cities in which they live. Some of these activities include but are not limited to: sewage system operations; public construction activities; vehicle maintenance; material storage; street and road maintenance; landscaping; recreational facility management; parking facility management; public industrial activities; and many other activities. These are essential services that unfortunately have potential side effects, albeit they are preventable or treatable. The Permittees also conduct some activities that are required to have separate coverage under the 1990 storm water regulations. These services or

activities undertaken by the Permittees, or by their contractors, sometimes mirror industrial activities and construction activities that a Permittee would actually place requirements upon, if the work were undertaken by and for a private party. The changes proposed by Regional Board staff are to bring consistency to requirements in this draft permit so that the end effect is pollution prevention.

Specific significant changes in the draft permit and their justifications are described below:

NEW REQUIREMENT: In sewage system operations, the proposed change is that each Permittee will be required to implement a response plan in case of an overflow of the sewage system to the storm drain system.

JUSTIFICATION: The response plan will have different requirements dependent upon whether the Permittee neither owns nor operates or maintains the sewer system to whether the Permittee owns and operates the sewer system. Because the responsibilities are different, the expectations of the Regional Board should therefore be different and the proposed language reflects this.

NEW REQUIREMENT: In public construction activity management, the proposed changes include generally, that the requirements in the construction section of the draft permit also apply to the Permittees public construction sites.

JUSTIFICATION: This is proposed to reduce the possibility of a public construction site from becoming a source of pollutants. A public construction site should be a model of what to do efficiently and effectively.

NEW REQUIREMENT: Each Permittee with a construction site that meets the size requirements for a GCASP shall obtain a permit from the State for the construction activity. Currently the size threshold is 5 acres but will change to 1 acre on March 10, 2003. However, a municipality of less than 100,000 people need not apply for the state permit for a construction activity until March 10, 2003.

JUSTIFICATION: This change is for consistency and will assist in the tracking of construction sites operated by Permittees.

NEW REQUIREMENT: For each Permittee owned construction site, the Permittee shall inspect and replace any ineffective BMPs when found.

JUSTIFICATION: This is to ensure that a properly designed and implemented BMP is properly maintained and is in proper working order during rains.

NEW REQUIREMENT: Each Permittee will be required to design and construct public facilities using construction and post-construction BMPs consistent with the Standard Urban Storm Water Mitigation Plans (SUSMPs) required under the Construction Planning section of the draft permit.

JUSTIFICATION: This is to be consistent with private projects and their planning, design, and construction requirements.

NEW REQUIREMENT: For Permittee owned or operated vehicle maintenance, material storage areas, and corporation yards the Permittees will implement site

specific SWPPPs to minimize pollutant discharges in storm water discharges. Vehicle and equipment wash areas will be required to be self contained or covered, equipped with a clarifier, or other pretreatment device, and or properly connected to the sanitary sewer. This requirement will take effect when a new facility is constructed or when an existing site is remodeled or reconstructed.

JUSTIFICATION: This is to be consistent with private projects and their planning, design, and construction requirements.

NEW REQUIREMENT: For landscape and recreational facilities the changes proposed include the handling and storage of materials under cover, or on secondary containment, and the inspection of such areas.

JUSTIFICATION: These changes are minimal, and simply reflect good house keeping practices that are easily and inexpensively made.

NEW REQUIREMENT: For storm drain operation and maintenance the changes proposed are the inspection and clean out of catch basin inlets between May 1 and September 30 of each year, and the classification of priority catch basins as those 40% or more full for additional cleaning between October 1 and April 30.

JUSTIFICATION: This is to be consistent with the Ventura County Municipal Storm Water Permit.

NEW REQUIREMENT: The Permittees shall keep records of catch basins cleaned and record overall quantity of wastes collected.

JUSTIFICATION: This change is a tool to assist the Permittees in tracking cleaning and amounts of wastes collected that can also be reported to the public and to federal and state agencies as to what was prevented from flowing to waters of the U.S.

NEW REQUIREMENT: For storm drain maintenance each Permittee must visually monitor their open channels for debris and identify and prioritize areas of illicit discharge for regular inspection and at least annually remove trash and debris from the channels. Permittees will review existing maintenance activities. After clean out, the material will be properly disposed of.

JUSTIFICATION: The annual clean out is a continuation of the 1996 Permit but the visual monitoring is a new requirement to assist the Permittees in prioritizing clean outs and mobilizing cleaning crews.

NEW REQUIREMENT: For street and road maintenance each Permittee will conduct street sweeping on curbed public streets in their permitted area at a monthly average, not less than four times per month, in areas generating high volumes of trash, and at a monthly average not less than two times per month in areas generating moderate volumes of trash on traffic collector streets and residential areas (except that for any Permittee within an area subject to a trash TMDL, the Permittee may implement a program which maximizes trash removal by using an effective combination of street sweeping, catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve waste load allocations).

JUSTIFICATION: The changes in frequency are to be consistent with the Ventura County Municipal Storm Water Discharge Permit. The language pertaining to complying with a TMDL Waste Load Allocation (WLA) is new and was created to provide the Permittees subject to TMDLs flexibility in complying with both the TMDL and this Order. By complying with the TMDL, the Permittee will be complying with this Order as it pertains to the listed sections only.

NEW REQUIREMENT: Permittee-owned parking lots shall be kept clear of debris and oil buildup and cleaned no less than two times per month and/or inspected no less than two times per month to determine if cleaning is necessary.

JUSTIFICATION: The proposed change is to require the inspection of the lots and to clean them when necessary. The proposed cleanup of oil spots and debris is to keep lots from becoming significant sources of pollutants.

NEW REQUIREMENT: Each Permittee shall require that sawcutting wastes be recovered and disposed of properly and that in no case shall waste be allowed to enter the storm drain.

JUSTIFICATION: Previously the requirement was that sawcutting not occur during a rain except by emergency. This requirement provides flexibility in implementation of BMPs with the ultimate result being no discharge of pollutants allowed to enter the storm drain system.

NEW REQUIREMENT: Concrete and other street and road maintenance materials and wastes shall be managed to prevent pollutant discharges

JUSTIFICATION: This requirement provides flexibility in implementation of BMPs with the ultimate result being no discharge of pollutants allowed to enter the storm drain system.

NEW REQUIREMENT: The washout of concrete trucks and chutes shall only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system.

JUSTIFICATION: Regional Board staff have seen inconsistent implementation of this requirement and have revised the language to be clearer while providing flexibility in implementation of BMPs with the ultimate result being no discharge of pollutants allowed to enter the storm drain system.

F. New Development And Significant Redevelopment Program

Water Quality and Storm Water

The water quality impacts of urbanization and urban storm water discharges have been summarized by several recent USEPA reports.[1] Urbanization causes changes in hydrology and increases pollutant loads which adversely impact water quality and impairs the beneficial uses of receiving waters. Increases in population density and imperviousness result in changes to stream hydrology including:

[1] *Storm Water Phase II Report to Congress* (USEPA 1995); Report to Congress on the Phase II Storm Water Regulations (USEPA1999); Coastal Zone Management Measures Guidance (USEPA 1992)

1. increased peak discharges compared to predevelopment levels;

2. increased volume of storm water runoff with each storm compared to pre-development levels;

3. decreased travel time to reach receiving water; increased frequency and severity of floods;

4. reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;

5. increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from chanellization, and

6. decreased infiltration and diminished groundwater recharge.

The Los Angeles County municipal storm water management MS4 program conducts monitoring to:

1. quantify mass emissions for pollutants,
2. identify critical sources for pollutants of concern in storm water;
3. evaluate BMP effectiveness, and
4. evaluate receiving water impacts.

The monitoring indicates that instream concentrations of pathogen indicators (fecal coliform and streptococcus), heavy metals (such as Pb, Cu, Zn,) and pesticides (such as diazinon) exceed state and federal water quality criteria.[1] The mass emissions of pollutants to the ocean are significant from the urban Watershed Management Areas (WMAs) such as the Los Angeles River WMA, Ballona Creek WMA, and Coyote Creek WMA, with the Los Angeles River WMA providing more than seventy percent of the loadings. Critical source data for facilities (such as auto-salvage yards, primary metal facilities, and automotive repair shops) showed that total and dissolved heavy metals (Pb, Cu, Zn, and Cd), and total suspended solids (TSS) exceeded state and federal water quality criteria by as much as one hundred times. The results are consistent with a limited term study conducted by the Regional Board to characterize storm water runoff in the Los Angeles region before the issuance of MS4 permits.[2] Storm water runoff data from predominant land uses showed similar patterns. Light-industrial, commercial and transportation land uses showed the highest range of exceedances. A pesticide (diazinon) showed higher ranges from residential land use. The data for polycyclic aromatic hydrocarbons (PAHs), a known pollutant of concern in urban storm water runoff, is inconclusive but improved analytical methods may yield more definitive results next year. Receiving water impacts studies found that storm water discharges from urban watersheds exhibit toxicity that are attributable to heavy metals. Biosurveys of the sea-bottom showed bioaccumulation of toxicants. Sediment analysis showed higher concentrations of pollutants, such as Pb and PAHs, in urban watersheds rather than rural watersheds (2 to 4 times higher). In addition, toxicity of dry weather flows was

[2] *Storm Water Runoff in Los Angeles and Ventura Counties, Final Report* (1988), California Regional Water Quality Control Board, Los Angeles, SCCWRP Contribution C292. This study found the highest mean concentrations of pollutants of concern such as heavy metals in the urban watershed rivers and that they contributed significant loads to the ocean.

observed with the cause of toxicity undetermined.[1] Previous studies have found chemical concentration of pollutants that exceed state and federal water quality criteria in storm drains flowing to the ocean,[2] and that there are adverse health impacts from swimming near them.[3]

Treatment BMP requirements on new development and redevelopment offer the most cost effective strategy to reduce pollutant loads to surface waters. Retrofit of existing development will be expensive and may be considered on a targeted basis. Studies on the economic impacts of watershed protection indicate that storm water quality management has a positive or at least neutral economic effect while greatly improving the quality of surface waters.[4]

Municipal storm water regulations at 40 CFR 122.26 require that pollutants in storm water be reduced to the MEP. The USEPA's definition is intentionally broad to provide maximum flexibility in MS4 permitting and to give municipalities the opportunity to optimize pollutant reductions on a program-to-program basis.[5] The definition of MEP has generally been applied to mean implementation of economically achievable management practices. Because storm water runoff rates can vary from storm to storm, the statistical probabilities of rainfall or runoff events become economically significant and are central to the control of pollutants through cost effective BMPs. Further, it is recommended that storm water BMPs be designed to manage both flows and water quality for best performance. [6] It is equally important that treatment BMPs once implemented be routinely maintained.

Financing the MS4 program offers a considerable challenge for municipalities. A proven successful financing mechanism is the establishment of a storm water utility.[7] Utility fees, which are assessed on the property owner based on some estimate of storm water runoff generated for the site, are a predictable and dedicated source of funds. Utility fees can also provide a mechanism to provide incentives to commercial and industrial property owners to reduce impervious surface areas. Such incentives offer flexibility to property owners to choose the better economic option – paying more fees or making improvements to reduce runoff from the site.

REVIEW OF DESIGN STANDARDS

The American Society of Civil Engineers (ASCE) and the Water Environment Federation (WEF) have recommended a numerical BMP design standard for storm water that is derived from a mathematical equation to maximize treatment of runoff volume for water quality based on rainfall/ runoff statistics and which is

economically sound.[1] The maximized treatment volume is cut-off at the point of diminishing returns for rainfall/ runoff frequency. On the basis of this equation the maximized runoff volume for eighty-five percent treatment of annual runoff volumes in California can range from 0.08 to 0.86 inches depending on the imperviousness of the watershed area and the mean rainfall.[2]

Other methods of establishing numerical BMP design standards include: (i) Percent treatment of the annual runoff; (ii) Full treatment of runoff from rainfall event equal to or less than a predetermined size; (iii) Percent reduction in runoff based on a rainfall event of standard size.[3] These numerical design standards have been applied to Development Planning in Puget Sound, WA; Alexandria, VA; Montgomery County, MD; Denver, CO; Orlando, FL; Portland, OR; and Austin, TX.

The City of Seattle requires that where new development coverage is 750 square feet or more, storm water detention be provided based on a 25 year storm return frequency, and a peak discharge rate not to exceed 0.2 cubic feet per second.[4] Additionally, for projects that add more than 9,000 square feet in developmental coverage, the peak drainage water discharge rate is limited to 0.15 cubic feet per second per acre for a two-year storm. The City of Denver requires new residential, commercial, and industrial developments to capture and treat the 80th percentile runoff event. This capture and proper treatment is estimated to remove 80 to 90 percent of the annual TSS load which is a surrogate measure for heavy metal and petroleum hydrocarbon pollutants.[5]

Some States have established numerical standards for sizing storm water post-construction BMPs for new development and significant redevelopment. The State of Maryland has established storm water numerical criteria for water quality of 0.9 to 1 inch, and BMP design standards in a unified approach combining water quality, stream erosion potential reduction, groundwater recharge, and flood control objectives.[6] The State of Florida has used numerical criteria to require treatment of storm water from new development since 1982, including BMPs sized for 80 percent reduction (95 percent for impaired waters) in annual TSS loads derived from the 90 percent (or greater for impaired waters) annual runoff treatment volume method for water quality.[7] The State of Washington has proposed at least six different approaches of establishing storm water numerical mitigation criteria for new development, which add 10,000 square feet of impervious surface or more for residential development, and 5,000 square feet of impervious surface or more for other types of development[8]. The mitigation

criteria options include the 90th percentile 24-hour rainfall event and the six month 24 hour rainfall event. The State of Maryland

On a national level, the USEPA is planning to standardize minimum BMP design and performance criteria for post-construction BMPs under Title III of the Clean Water Act, and will likely build from the experience of effective state and local programs to establish national criteria.[1] The USEPA, based on the National Urban Runoff Program, supports the first half-inch of rainfall as generating first flush runoff.[2] First flush runoff is associated with the highest pollutant concentrations, and not pollutant load. The USEPA considers the first flush treatment method, the rainfall volume method, and the runoff capture volume method as common approaches for sizing of water quality BMPs.

BACKGROUND IN THE LOS ANGELES REGION

Los Angeles County and municipalities within the County (except the City of Long Beach) implement a municipal storm water program to reduce storm water and urban runoff pollution under the requirements of Board Order No. 96-054. The Los Angeles County Municipal Storm Water Permit includes requirements that SUSMPs be prepared for priority planning projects and that they include appropriate BMPs and guidelines to reduce pollutants in storm water to the MEP.[3]

On April 22, 1999, the Regional Board approved a List of BMPs for MS4 Permittees to select from and required implementation of the most effective BMPs in their Development Planning and Development Construction programs.[4]

Los Angeles County Department of Public Works (LACDPW), on behalf of the Permittees, submitted SUSMPs for the Regional Board Executive Officer on July 22, 1999, which was revised and resubmitted on August 12, 1999.

The Regional Board on January 26, 2000 approved a Final SUSMP, which included requirements for the following categories. The Regional Board Executive Officer issued a Board Approved Final SUSMP on March 8, 2000, which established new development and significant redevelopment conditions for all projects in the following categories,

10 or more home subdivision;
100,000+ square-foot commercial development;
automotive repair facilities;
retail gasoline outlets;
restaurants;
parking lots more than 5,000 square feet or more than 25 parking spaces
hillside located single-family dwelling,
construction projects adjacent to, in, or discharging directly to environmentally sensitive areas

[3] The Los Angeles County Municipal Storm Water Permit (Permit Pt. 2. III.A.)
[4] (Board Resolution No. 99-03)

The SUSMP included numerical design criteria for structural and treatment control BMPs.

Numerical Design Standard

Mitigate (infiltrate or treat) storm water runoff from either:

a) each runoff event up to and including the 85th percentile 24-hour runoff event, determined as the maximized capture storm water volume for the area from the formula recommended by the WEF and ASCE study[1] or

b) the annual runoff volume, based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in the BMP Handbook[2], or

c) the volume of runoff produced from each and every storm event up to and including 0.75 inch of rainfall, prior to its discharge to a storm water conveyance system, or

d) the volume of runoff produced from each and every storm event up to and including a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.

The Regional Board action was appealed to the State Water Resources Control Board by a coalition of cities, the Building Industry Association of Southern California (BIA), and the Western States Petroleum Association (WSPA). The State Board issued a precedential decision[3] on the matter in Order WQ 2000-11, largely sustaining the SUSMP as approved by the Regional Board. The State Board amended the SUSMP to limit its application to discretionary projects as defined by CEQA, eliminated the category for projects in environmentally sensitive areas, and set aside the requirement for retail gasoline outlets to treat storm water until a threshold is developed in the future. In addition the State Board articulated its support for regional solutions and the mitigation banking.

The Regional Board staff proposes to modify SUSMP requirements to clarify implementation, make it consistent with recent Regional Board actions, and where appropriate cure procedural and other deficiencies identified by the State Board in its SUSMP ruling. In the revised permit, staff proposes to:

require SUSMPs for hillside developments that are 10,000 square feet or more. Hillside residential homes below the threshold would be required to incorporate

[1] *In Urban Runoff Quality Management, WEF Manual of Practice No. 23, ASCE Manual and Report on Engineering Practice No. 87.* WEF, Alexandria, VA; ASCE, Reston, VA. (1998).
[2] *California Storm water Best Management Practices Handbook – Industrial/ Commercial,* (1993)
[3] *State Water Board Order WQ 2000-11*: SUSMP; Memorandum from Chief Counsel to Regional Board Executive Officers, (December 26, 2000) discusses statewide policy implications of the decision.

BMPs to facilitate drainage and pollutant removal but would not be subject to the numerical mitigation criteria. Currently, all hillside developments regardless of size are subject to the numerical mitigation criteria.

require retail gasoline stations be subject to the numerical mitigation criteria, where they meet certain thresholds such as: (i) projected gasoline output of 25,000 gallons per month or more; (ii) four or more fueling dispensers, (iii) 24 or more dispensing meters; (iv) projected average daily traffic of 100 cars or more; and (v) 5,000 square feet or more of surface area.

amend the 100,000 square feet commercial development to include heavy industrial development. The category will be designated 'industrial/commercial'.

lower the industrial/commercial category threshold from 100,000 square feet to 1-acre (40,000 square feet) beginning March 9, 2003, to be consistent with the USEPA Phase 2 Final Rule for small construction projects.

require the application of new development requirements to all developments, both ministerial and discretionary. As presently implemented the SUSMP requirements apply to only discretionary projects as defined under the California Environmental Quality Act.

require to include as a category projects situated in, adjacent to, or discharging directly to environmentally sensitive areas where the development (a) creates 2,500 square feet or more of impervious area, or (b) alters the area of imperviousness of the site to ten or more percent of the naturally occurring condition, and (c) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat.

include numerical mitigation criteria for flow-based structural and treatment BMPs to be consistent with recent municipal storm water permits issued by the Regional Board.[1] These criteria are:

> the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity, or
> the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County
> the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above

In addition staff propose that under the New Development Requirements Permittees update CEQA Documents with immediate effect and General Plans no later than 18 months from permit adoption to address storm water considerations. Both these requirements currently exist in the permit but there is no firm deadline for complying with the requirement.

The attached technical papers provide more detail.

VI. MONITORING PROGRAM

R0003103

[1] *Board Order No. 00-018; NPDES Permit No. CAS004002.* Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within Ventura County Flood Control District, County of Ventura, and the Cities of Ventura County

Background:

Using data collected from a monitoring program, storm water management efforts can be prioritized, helping limited resources be most effective in improving receiving water quality. For example, a monitoring program can provide data that can allow for specific receiving waters and watersheds to be targeted for urban runoff management and education efforts based on their need. Particular pollutants and their sources can also be identified and targeted using monitoring data. In addition, monitoring data can be useful in assessing the effectiveness of an urban runoff management program. Successful efforts that have resulted in receiving water quality improvements can be analyzed for application elsewhere, while areas that need greater efforts can also be identified. In general, a comprehensive monitoring program can supply a wealth of data that can be used in a wide range of applications for improving water quality.

Storm Water Monitoring History:

In the 1994-95 storm season, the Los Angeles County Department of Public Works began monitoring storm water quality in Los Angeles County. The first two years of monitoring were conducted pursuant to the 1990 permit. Over the past five years, the Los Angeles County storm water monitoring program consisted of four main components: mass emission monitoring, land use monitoring, critical source monitoring, and a Santa Monica Bay receiving water study. The results of each objective are summarized below.

- **Mass Emission Monitoring**

  Mass emissions were monitored for four major watersheds: Ballona Creek, Malibu Creek, Los Angeles River, and San Gabriel River. The County also monitored mass emissions from Coyote Creek, although it was not a requirement of Order 96-045. The mass emission monitoring successfully identified 32 pollutants of concern, including toxic levels of zinc and copper from Ballona Creek discharge, toxicity in the Los Angeles and San Gabriel Rivers, and the extent of severity of bacterial indicators in both dry and wet weather. The Los Angeles River was found to consistently contribute the most zinc, copper and suspended solids.

- **Land Use Monitoring**

  The County selected eight land use types to be monitored to identify sources of pollutants in storm water monitoring. These land uses include retail/commercial, vacant, high-density single family residential, transportation, light industrial, education, multifamily residential, and mixed residential. Light industrial, transportation, and retail/commercial land uses were identified as producing the highest median concentrations for total and dissolved zinc. Light industrial and transportation displayed the highest median concentrations for total and dissolved copper, and light industrial produced the highest concentrations of suspended solids. The land use monitoring data has not provided significant information to the storm water management program. However, the required event mean concentrations were not all derived during the last five years of monitoring, so the program will be continue until it is complete.

- **Critical Source Monitoring**

  Five critical sources, including industrial and commercial facilities, were monitored to evaluate the effectiveness of voluntary good housekeeping and preventative BMPs. The critical sources included in the study were motor freight, auto dealers, chemical

manufacturing, machinery manufacturing, and rubber/plastics. No significant difference in storm water quality was found between critical source industries that implemented BMPs and those that did not. A significant finding was that the metal fabrication industry was identified as producing the highest median concentrations for zinc, copper, and suspended solids. Due to the inability to require or control the implementation of BMPs, this study was ineffective at evaluating BMP effectiveness.

- **Receiving Water Study**

  A three-year study was conducted to assess the impacts of urban storm water runoff, specifically ecosystem health, on the receiving waters of the Santa Monica Bay. The study examined plume characteristics, water column and seafloor biology. Ballona and Malibu Creek were compared to evaluate the effects of different watershed types. The study discerned the presence of well-developed plumes containing toxic materials, identified zinc and copper as contaminants in Ballona Creek, and concluded that sediments offshore of Ballona Creek generally had higher concentrations of urban contaminants. These findings demonstrate the need for further studies.

Proposed Storm Water Monitoring Program:

The objectives of this program include, but are not limited to: 1) assessing compliance with the MS4 permit; 2) measuring and improving the effectiveness of the SQMP; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality.

Mass Emissions Monitoring

The Principal Permittee shall monitor mass emissions from seven stations, as opposed to four in Order 96-054. The Principal Permittee proposed to continue monitoring the Coyote Creek station, and new stations were required in Dominguez Channel, and the Santa Clara River.

The Dominguez Channel watershed contains the highest percentage of impervious area. The Center for Watershed Protection has linked overall watershed imperviousness to storm water quality problems.[1] Also, the Dominguez Channel Watershed is a highly industrialized area and the storm water runoff needs to be characterized to determine its contribution of pollutants in the San Pedro Bay.

A new mass emission station in the Santa Clara watershed is also required. The purpose of this station is to characterize mass emissions from Los Angeles County and to monitor the impacts from new development. Therefore, the station should be located as close to the Ventura County line as practicable. The Santa Clara watershed is currently the most natural and least impacted by development in the County. However, it is rapidly developing and contains a significant amount of proposed development. Several factors, including the natural state of the river and the lack of accessibility, have made it difficult to select a location for a sampling station. The Principal Permittee and the County are currently working together to find an appropriate location.

Method Detection Limits

[1] need citation for CWP

For the first storm of each year, method detection limits (MDLs) lower than or equal to the minimum levels in the State Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2000 (SIP) shall be used. If minimum levels are not detected, the MDLs from Order 96-054 may be used. The purpose of this new requirement is to detect toxic levels of constituents. If the lower MDLs are not used, toxic levels may not be detected.

TSS Monitoring

Every storm greater than .25 inch shall be sampled and analyzed for TSS. The purpose of this requirement is to consider the high variability of storm water discharges and determine more accurate average mass emission values. The high variability of storm water makes it unlikely to characterize a storm season based on a few mass emission samples. Studies show that the median event mean concentration for storm water programs that do not sample every storm is consistently biased low, relative to the annual flow-weighted mean[1]. To adequately characterize a storm and capture central tendencies, many storms would need to be sampled. However, this is cost-prohibitive. Therefore, the correlation between TSS and trace metals should be used. Studies have indicated that runoff contaminants tend to be highly correlated with suspended solids in large rivers and creeks throughout southern California[2]. TSS measurements are one-tenth the cost of trace metal analyses. However, TSS concentrations accounted for up to 95% of the variability in some trace metal concentrations in a study of the Santa Ana River (urbanized watershed in Orange County) conducted by the Southern California Coastal Water Research Project (SCCWRP)[2].

Water Column Toxicity Monitoring

Previous storm water quality monitoring provides justification for this requirement. Storm water samples were found to be toxic in the Los Angeles River, the San Gabriel River, Ballona Creek, and the Santa Monica Bay, demonstrating the need for continued studies and source identification.

Furthermore, previous toxicity testing was only conducted using the Stronglyocentrotus purpuratus (sea urchin) fertilization test, a marine species. In order to assess the impacts that storm water has on the inland receiving waters before it reaches the ocean, toxicity testing must also be conducted on a fresh water organism. Therefore, all tests will be conducted using the sea urchin and the Ceriodaphnia dubia (water flea). Sea urchins are sensitive to metals, while the Ceriodaphnia is sensitive to pesticides. Both of these are known impairments in this region. Samples from the Santa Clara mass emission station only need to be analyzed for toxicity to the freshwater species, because the station is located inland. Two wet weather and two dry weather samples will be analyzed for toxicity from each mass emission station every year.
Toxicity Identification Evaluations (TIE) will be conducted when two consecutive samples show toxicity. The rationale for using two toxicity hits as a trigger is based on the toxicity guidelines and requirements for NPDES permits, developed by this Regional Board. Also, storm water discharges are highly variable and requiring a TIE whenever a single sample shows toxicity, which could be a one-time event, is not cost-effective.

Furthermore, when a toxic pollutant is identified, Toxicity Reduction Evaluations (TRE) will be conducted. The purpose of this requirement is to evaluate the extent and causes

[1] Temporal variability patterns of stormwater concentrations in urban stormwater runoff. Leisl L. Tiefenthaler, Kenneth C. Schiff, and Molly Leecaster, Southern California Coastal Water Research Project (SCCWRP) annual Report 2000.
[2] SCCWRP. 1992. Surface runoff to the Southern California Bight.

of toxicity in inland and coastal receiving waters, and to eliminate or reduce the sources of toxicity in storm water. TRE development and implementation is directly tied to the SQMP, to ensure that management actions are taken when problems are identified. The Principal Permittee expressed concern to Regional Board staff that the TRE requirement could potentially be too involved and costly to be completed with the available funds and resources during the course of the Order. To address this concern, the Regional Board clarified the TRE language. It was decided that a third party should be involved in the source analysis and BMP recommendations, and that each Permittee shall be responsible for the implementation of BMPs in their areas of jurisdiction that are causing or contributing to toxicity. The Principal Permittee is responsible for conducting an analysis of possible sources of toxicity and the identification of appropriate BMPs, based on available information. Regional Board staff also agreed with the Principal Permittee's proposed funding limit for this requirement, to ensure that the majority of the monitoring budget is not used.

Overall, the toxicity monitoring program will assess the impact of storm water on the overall quality of aquatic systems and implement measures to ensure that those impacts are eliminated or reduced. Chemical monitoring does not necessarily reveal the impacts of storm water on aquatic life or beneficial uses of water bodies. Therefore, toxicity monitoring is a necessary component of a storm water monitoring program.

Tributary/Source Identification Monitoring

Based on the results of previous storm water quality monitoring and toxicity testing, there is a need to monitor subwatersheds to determine pollutant sources, prioritize management actions, and provide information for TMDL development and implementation. Regional Board staff worked with Los Angeles County staff to design a tributary monitoring program.

Due to the great number of tributaries and limited resources for monitoring, the goals of the tributary monitoring program were prioritized. Regional Board staff decided to focus on metals in the Los Angeles River, San Gabriel River, and Ballona Creek because of existing data and the TMDL schedule[1]. Staff requested that the Principal Permittee conduct an analysis of the last four years of data for land use type, area, and rainfall to determine the major tributaries with the highest loads of metals per acre. Based on the analysis, Regional Board staff selected the following tributaries to be monitored:

- Centinela Creek (Ballona Creek WMA)
- Kenter Canyon (Ballona Creek WMA)
- Aliso Creek (Los Angeles River WMA)
- Bull Creek (Los Angeles River WMA)
- Compton Creek (Los Angeles River WMA)
- Los Cerritos Channel (San Gabriel River WMA)
- San Jose Creek (San Gabriel River WMA)

The data from the tributary monitoring program will also be used to validate the Land Use Model that the County has been developing.

Shoreline Monitoring

[1] Current TMDL schedule can be found on the Regional Board website at www.swrcb.ca.gov/rwqcb4/docs/table7_wmi_appdx.pdf

The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline monitoring requirement be incorporated in this Order. Regional Board staff and the County of Los Angeles determined that the shoreline monitoring is an appropriate requirement for the storm water monitoring program, per the conditions listed in Section D of the draft Monitoring Program.

Trash Monitoring

Trash is a storm water pollutant, and a monitoring program should be developed. The language in the draft is general so that details of the monitoring program can be determined through the TMDL process. A specific trash monitoring program will be required through a 13267[1] letter related to the TMDL. The Regional Board does not intend to require two separate monitoring programs through the MS4 permit and the TMDL.

Regional Monitoring

Regional Monitoring efforts address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Los Angeles County is a major discharger in this region and should participate in regional programs. Also, participation in Regional Monitoring, such as the SCCWRP Bight-wide study in 2003, can accomplish several goals of the Monitoring Program.

Estuary Sampling

The main goal of the estuary sampling is to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. Form this information, a map of each estuary that depicts the impacted areas will be produced. Such a map will be used to direct future monitoring efforts. Once the impacted areas are identified, regular monitoring can be conducted to determine trends and accumulation of sediment from storm water. The specific sampling requirements are consistent with the Hyperion Waste Water Treatment Plant NPDES permit. This sampling program is also consistent with the objectives of the SCCWRP Bight-wide 2003 study. The results will be incorporated into a larger study of the entire coast of Southern California, from Santa Barbara to the boarder of Mexico. This will also provide a comparison of the storm water impacts from Los Angeles County to other larger MS4s.

Bioassessment

Bioassessment data can be an important indicator of stream health and storm water impacts. It can detect impacts that chemical and physical monitoring cannot. In the Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems, EPA encourages permitting authorities to consider requiring biological monitoring methods to fully characterize the nature and extent of storm water problems. Therefore, this Regional Board and other Regional Boards commonly require bioassessment monitoring in storm water and point source NPDES permits.

[1] Section 13267 of the Porter-Cologne Water Quality Act

However, the fact that a biological index does not yet exist for this region is an issue that Regional Board staff took into consideration for this requirement. Without a biological index, including reference conditions and knowledge of background variability, data cannot be fully analyzed to accurately indicate stream health or impacts. However, it can be used to determine trends in the biological community, and it is necessary for index development. Also, bioassessment data can be analyzed in the future, after an index is developed.

Considering the importance of bioassessment and the need for an index, the Principal Permittee is required to develop a bioassessment program as part of a regional effort (Southern California Stormwater Research/Monitoring Program) and to coordinate with the Surface Water Ambient Monitoring Program (SWAMP), organized by the Regional Board. This is to ensure that the most useful data is collected for the purposes of detecting biological trends in receiving waters and for developing a biological index.

New Development Impact Study in the Santa Clara Watershed

The Santa Clara River is the largest river system in southern California that remains in a relatively natural state. For much of its length, it is a high quality natural resource[1]. There is also a great amount of current and future development in the watershed. Therefore, it is important to monitor this watershed to detect water quality impacts from new development and implement measures to prevent degradation from occurring. To accomplish this, a special study in addition to the two mass emission stations is appropriate.

The special study will consist of monitoring tributaries in the Santa Clara watershed to accomplish two goals. The first is to determine impacts from new development. The second is to assess the effectiveness of SUSMPs by comparing storm water quality between subwatersheds with and without post-construction storm water BMPs. Two tributary stations will be selected and monitored for this study. One will be chosen that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation. The second station will be representative of a subwatershed in which the majority of development has/will include SUSMP implementation.

Due to the similarities in sites to be monitored, it may be appropriate to combine this study with the Peak Discharge Impact Study.

Due to the similarities in sites to be monitored, it may be appropriate to combine this study with the Peak Discharge Impact Study.

Peak Discharge Impact Study

The Development Planning section (Part 4.C.2) of the draft permit requires that the Principal Permittee determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization. The purpose of the Peak Discharge Impact Study is to help meet that requirement. The Ventura County MS4 permit contains a similar requirement. The Ventura County Flood Control District has designed a study that can be extended to a watershed in Los Angeles County.

[1] Watershed Management Initiative Chapter, January 2000. California Regional Water Quality Control Board, Los Angeles Region

BMP Effectiveness Study

The BMP Effectiveness Study is an integral part of the storm water monitoring program. It is necessary to determine the reduction of pollutants from different BMPs so that the storm water management agency can make educated determinations about appropriate locations and types of BMPs.

RETAIL GASOLINE OUTLETS: NEW DEVELOPMENT DESIGN STANDARDS FOR MITIGATION OF STORM WATER IMPACTS

Technical Report

June 2001

San Diego, CA 92124

Introduction

On March 8, 2000, the California Regional Water Quality Control Board, Los Angeles Region (LA Regional Board) issued requirements for new development and significant redevelopment consolidated in a Standard Urban Storm Water Mitigation Plan (SUSMP). The SUSMP included requirements for retail gasoline outlets (RGOs), commonly referred to as "gas stations", among several other development categories. Several municipalities, the Building Industry of Southern California (BIA), and the Western States Petroleum Association (WSPA) appealed the action of the LA Regional Board to the State Water Resources Control Board (State Board) for review. The State Board issued its decision *In Re City of Bellflower et al.* (SUSMP Decision) in large part upholding the action of the LA Regional Board.

In its Order, the State Board set aside the numerical mitigation requirement for RGOs explaining that the decision did not preclude future inclusion of numerical mitigation standards for RGOs with proper justification.

On February 21, 2001, the California Regional Water Quality Control Board, San Diego Region (SD Regional Board) issued an MS4 permit for San Diego County and Cities which includes requirements for new development and significant redevelopment. The MS4 permit requires Permittees to develop a model SUSMP no later than February 21, 2002, that will establish new development controls for project categories including RGOs. The SD Regional Board did not propose a threshold for RGOs to apply numerical design standards, giving the MS4 permittees the first option to develop the threshold criterion for RGOs and the justification. On March 22, WSPA filed an appeal of the SD Regional Board action for review before the State Board contending that RGOs were being improperly subject to numerical design standards in the MS4 permit for San Diego County and cities.

Urbanization and Storm Water Quality

Urbanization alters the natural infiltration capability of the land and generates a host of pollutants that are entrained in storm water and urban runoff. These pollutants such as heavy metals and petroleum hydrocarbons result from the activities of dense human populations. The overall impact is an increase in storm water runoff volumes and pollutant loading in storm water discharged to receiving water-bodies.[1]

Urban development increases the amount of impervious surface in a watershed as farmland, forests, and meadowlands with natural infiltration characteristics are converted into buildings with rooftops, driveways, sidewalks, roads, and parking lots with virtually no ability to absorb storm water. Storm water and snow-melt runoff wash over these impervious areas, picking up pollutants along the way while gaining speed and volume because of their inability to disperse and filter into the ground. What results are storm water flows that are higher in volume, pollutants, and temperature than the flows in less impervious areas, which have more natural vegetation and soil to filter the runoff.[2] In addition to impervious areas increase, urban development brings with it proportionately high levels of car emissions, car maintenance waste, pet waste, litter, pesticides, and household hazardous wastes, which may be washed into receiving waters by storm water or dumped directly into storm drains designed to discharge to receiving waters.

Most organic compounds found in storm water are associated with various human-related activities, especially automobile use, or are associated with plastics.[3] Heavy metals found in storm water also mostly originate from automobile use activities, including gasoline combustion, brake lining, fluids, undercoatings, and tire wear.[4]

More recently, studies reveal a connection between urban development and contamination of local waterbodies. Studies found the highest levels of organic contaminants, known as polycyclic aromatic hydrocarbons (PAHs) (products of combustion including fossil fuels combustion), in the reservoirs of urbanized watersheds.[5] Studies also established a clear

relationship between the adverse impact of urbanization and impairment of aquatic communities in receiving waterbodies.[6]

Federal Storm Water Regulations

Federal regulations require that MS4 permittees implement a program to control storm water pollution from new developments during and post-construction. Because there is no express national standard for the control of storm water pollutants from new developments, the permitting authority must defer to statements of policy and intent made by the U.S.EPA.

The U.S.EPA under Phase I regulations did not fully describe the expectations for MS4 Permittees in controlling post construction storm water discharges from new development and significant redevelopment except that "a comprehensive master plan" was required [55 *Fed Reg.* 48054]. For a better understanding of the regulatory expectation, we look to the Final Rule for Phase II storm water regulations. Therein, the U.S.EPA notes that "prior planning and designing for the minimization of pollutants in storm water is the most cost-effective approach to storm water quality management" [64 *Fed Reg.* 68759], and identifies four essential elements to control storm water from new development and redevelopment. These are, (i) to develop and implement strategies that include a combination of structural and non-structural BMPs; (ii) adopt an ordinance to address post construction runoff; (iii) ensure long term operation and maintenance of the BMPs; and (iv) ensure that controls are in place that will *minimize* water quality impacts. [Emphasis added] EPA goes on to say:

> "The requirements .....[are] consistent with the permit application requirements for large MS4s for post-construction controls for new development and redevelopment."

The permitting authority in order to comply with federal regulations must thus require the implementation of an MS4 program that will achieve all four enumerated objectives for new development and redevelopment. In order for the program to be enforceable, the program for new development and significant redevelopment must include objective criteria such as water quality design standards for treatment-control BMPs, for significant categories of development such as RGOs.

Further, the Federal Court of Appeals has unequivocally stated that Congress intended for "the Administrator or a State to design [substantive] controls" for storm water discharges from MS4s but did not mandate a particular approach [*NRDC v. USEPA*, 966 F.2d 1292 (9th Cir. 1992)]. The court held that it is appropriate to defer to U.S.EPA [and the State] where the agency supplied a "reasoned explanation".

Also, the USEPA is currently in the process of developing effluent guidelines for the construction and development industry, which will include controls for new development and significant redevelopment.[7]

Retail Gasoline Outlets

RGOs can range in size from about 3,000 square feet to more than 200,000 square feet. The median size of new RGOs in Los Angeles County is about 13,000 square feet.[8] There are about 2,133 RGOs in Los Angeles County servicing a population of 9.5 million, and nearly six million registered motor vehicles.[9] In San Diego County there are about 700 RGOs serving a population of 2.8 million, and nearly 2 million registered vehicles.

RGOs are points of confluence for motor vehicles for automotive related services such as repair, refueling, and ancillary services such as tire air inflation and radiator fillup. The vehicular traffic patterns at RGOs are similar to those on parking lots and on highways. Researchers have identified RGOs as toxic pollutant hotspots.[10]

Storm Water Quality

RGOs are a well identified source of urban storm water pollutants that impair receiving waters. WSPA has acknowledged that storm water discharges from even "normally operated and maintained" RGOs are no worse than discharges from commercial parking lots and diffuse urban runoff.[11] The reason that "normally operated and maintained" RGOs do not demonstrate any improvement in storm water discharge quality is because existing BMPs do not address pollutants generated by motor-vehicle traffic.[12] Heavy metals, significant concentrations of which occur in storm water discharges from RGOs, have been demonstrated to be the main cause of toxicity in Santa Monica Bay during wet weather.[13] Oil and grease in the storm water discharges from RGOs are also of concern.[14]

In a study conducted in Maryland, RGOs were identified to generate significantly higher concentrations of hydrocarbon and heavy metals than parking lots, convenience store lots, and streets.[15] A study conducted in Sacramento County, California, identified heavy metals such as

A survey of oil and grit separators in suburban Maryland indicated that RGOs and convenience stores had much higher levels of hydrocarbons and metals both in the water column and the sediments.

lead, copper, and zinc, as significant in storm water from RGOs.[16] Volatile organic compounds (VOCs) such as benzene, toluene, ethylbenzene, and xylene are rarely detected in storm water because of their volatility. In contrast, gasoline and other solvents, because of their physical and chemical characteristics, may present a significant risk for groundwater contamination, if underground and aboveground storage tanks leak.

The sources of storm water pollutants at RGO are from tail-pipe exhaust particles, fluid losses, drips, spills, and mechanical, brakepad and tire wear products, which build up on impervious surfaces at RGOs.[17] The pollutants of most concern in storm water are heavy metals such as Pb, Cu, and Zn and petroleum hydrocarbons such as PAHs.[18] The concentration and loads of these pollutants in storm water runoff from RGOs depends on the surface deposition and removal rates, and permanent storage. The permanent storage on surfaces is a function of surface area texture and condition and is literally trapped in the texture or cracks of the surface area. Pollutants are deposited any where vehicles travel, park, or are serviced, including RGOs.[19]

Review of New Development Design Standards

WSPA represents petroleum industry members in the States of Arizona, Hawaii, Nevada, Oregon, in addition to California. WSPA in its Petitions before the State Board has contended that new development standards that include numerical design standards for BMPs are impracticable and unnecessary at RGOs, and so we focussed the review on development standards that new RGOs are subject to in Western U.S. States. We are aware that new RGO developments in other States such as Maryland, Virginia, Florida, Alabama, Tennessee. Georgia, Oklahoma and Texas, are also subject to numerical mitigation requirements for storm water pollutants, but we did not review their programs for this technical report.

In Washington, RGOs in the western region that create impervious surfaces of 5,000 square feet or more are required to mitigate the 6 month 24 hour storm (about 1.2 inches of rainfall). In addition to the standard treatment menu based on a water quality design storm, RGOs that are expected to generate ADT of 100 vehicles or more per 1,000 square feet of gross building area are required separately to treat to remove oil.[20] The City of Portland in Oregon under its MS4 program requires RGOs to mitigate storm water runoff from impervious areas equal to or greater than 500 square feet using any one of three different design

[16] *Action Plan Demonstration Project (APDP) - Demonstration of Gasoline Fueling Station Best Management Practices, County of Sacramento, (1994)*, pp. 30 Submitted to US EPA Region IX, San Francisco Estuary Project.. This study funded by the USEPA and conducted by Sacramento County identified heavy metals such as lead, copper, and zinc in significant concentrations in storm water runoff from RGOs. Volatile Organic Compounds (VOCs) from fueling areas were rarely detected because of their volatility. Data on Polycyclic Aromatic Hydrocarbons (PAHs) was inconclusive because analytical detection limits used were higher than regulatory action levels.

[20] Such sites are considered "high use sites" because they typically generate high concentrations of oil from traffic turnover. See Stormwater Management Manual for Western Washington, Vol. V, Runoff Treatment BMPs, (2000), Washington Department of Ecology, p 145.

approaches.[21] One of the choices is the 24-hour rainfall event standard (0.83 inch of rainfall). In addition, RGOs that are expected to generate 100 vehicles or more ADT per 1000 square feet of gross building area are subject to separate treatment controls for oil using a water quality design standard of a two year 24 hour storm.[22] In both Washington and Oregon, storm water treatment is required in addition to the source control BMPs identified by WSPA for implementation at its facilities in California.[23]

Treatment Control BMPs

The U.S. EPA funded a demonstration project to evaluate the effectiveness of on-line media filter media to treat pollutants from storm discharges at RGOs.[24] Four on-line media filter systems were tested and the study concluded that the treatment systems had sufficient ability to remove pollutants without risk of flooding, were easy to operate and maintain, and reasonable in capital cost.

We also reviewed storm water quality data results evaluating the pollutant removal effectiveness of a proprietary on-line filter media device located at a large RGO in Washington.[25] The device was installed underground and thus occupied no surface area. The treatment device was effective in removing between 50 and 90 percent of pollutants of concern in storm water discharges from RGOs. We note with interest that in perusing the treatment devices installation list of this proprietary manufacturer between 1997 and 2001 in the Western U.S., California had not a single installation at an RGO but Oregon and Washington had a combined total of 13 RGO sites where the treatment devices were installed. Considering that RGOs in the State of Washington and Oregon have ADT that is much less than in California, the aberration can only be explained by the lack of rigorous storm water regulatory controls in California to control the discharge of pollutants in storm water discharges from RGOs.[26]

Our review indicates that effective treatment devices for RGOs include on-line media filter systems with a combination of media placed in series to remove the pollutants of concern. Sand filters are another option. There may be other treatment control BMPs that may be equally if not more effective.[27]

Economic Considerations

A review of costs of storm water treatment controls for RGOs indicates that the cost of storm water treatment is reasonable.[28] In addition, a demonstration project sponsored by the USEPA to evaluate the effectiveness and costs of on-line media filters placed the first year capital cost between $250 and $900 and an operations and maintenance cost of $240 annually.[29]

Justification

The State Board in its SUSMP Decision temporarily excluded RGOs from the numerical mitigation standard until Regional Boards provided proper justification and established appropriate thresholds. Issues to be considered included presumptions that RGOs were, (i) already heavily regulated; (ii) limited in their ability to construct infiltration BMPs; (iii) generally small in size; and (iv) storm water treatment may not be feasible or safe.

Over-regulation:[30] Under State law, the State Board and Regional Boards are the primary authorities for implementation of the federal Clean Water Act, and for matters related to water quality within the State.[31] There is no basis in federal or State statute that permits the State Board or Regional Boards to abdicate their water quality authority because discharges from facilities that impact water quality are already regulated for other purposes. Attainment and maintenance of receiving water objectives and the protection of beneficial uses are the paramount considerations.

Limitations of space or ability: Our review indicates that RGOs appear not to be limited by space or ability to treat storm water. The surface area of RGO developments is generally greater than 5000 square feet. The fabricated storm water treatment systems we reviewed generally do not exceed 128 square feet in surface area when installed and do not impede traffic flow because they are situated sub-surface. While opportunities for infiltration practices may be limited, it is but one type of option for mitigation of pollutants in storm water. The SUSMP does not mandate infiltration BMPs. Other treatment options exist such as fabricated treatment control BMPs to remove storm water runoff pollutants using physical, biological, or chemical processes. Also treatment control BMPs can be installed sub-surface without interfering with surface use. RGOs situated in other Western U.S. States, which have lower impervious surface area and higher water quality treatment volume criteria thresholds already implement storm water treatment controls at new facilities.

---

[28] See "Cost and Benefits of Storm Water BMPs", Preliminary Data Summary of Urban Storm Water Best Management Practices, USEPA, (1999) Report No. EPA-821-R-99-0012, pp. 6-1 – 6-44.

[29] Rouge River National Wet Weather Demonstration Project, MI, - Evaluation of On-line Media Filters in the Rouge River Watershed, Report No. RPO-NPS-TPM59.00 (1999), at p 15-18.

[30] The Regional Board's review of regulations that affect RGOs identified, (i) business license for business operation, (ii) Fire Department for tank/ piping integrity and gasoline storage; (iii) County Public Works for underground storage of hazardous chemicals; (iv) Air Quality Management District for VOC emissions; (v) Sanitation District for any sanitary sewer discharges; (vi) County Weights and Measures for sale of gasoline; (vi) Department of Toxics Substance Control for waste motor oil disposal; (vii) County Health for food and beverage sale; and (viii) Regional Board for regulation of leaking tanks to protect groundwater.

[31] Cal. Wat. Code § 13160 states that, "the State Board is designated as the state water pollution control authority for all purposes.... in federal act." Cal. Pub. Res. Code § 30412 states that, "other State agencies shall not modify, adopt conditions, or take any action in conflict with any determination by the State Board in matters relating to water quality".

Feasibility of storm water treatment: Our review of implementation of storm water treatment control requirements in other Western U.S. States indicates that storm water treatment at RGOs is both feasible and safe. In California, sub-surface fabricated treatment systems have been commonly used at RGOs to separate waste-oil before discharge to the sanitary sewer system. Safety or feasibility has not been an issue when sanitation districts required RGOs to install treatment systems in order to obtain connection permits to the sanitary sewer system. As previously mentioned storm water treatment controls are installed as a matter of practice by RGOs in other Western U.S. States. There is no reason to suppose that storm water treatment in California introduces new and different safety and feasibility considerations, as when compared to wastewater treatment systems which RGOs have readily installed in California and storm water treatment systems installed in other Western U.S. States.

Suggested criteria

Storm water pollution at RGOs is primarily a function of the number of motor vehicles that are refueled or serviced. Ancillary services such as auto repair may additionally contribute significant pollutant loads. A WSPA study concluded that the storm water runoff quality from well-maintained RGOs is comparable in pollutant concentrations to runoff from commercial parking lots.[32]

The State Board recommended that the Regional Boards undertake further consideration of a threshold relative to size of RGOs for application of the numerical design standard for storm water. Our analysis indicated the following criteria for thresholds may be appropriate.

Land area: 5,000 square feet or more of impervious area. RGOs in Portland, Oregon and Western Washington that meet this land area threshold are currently subject to storm water treatment requirements based on the water quality design storm.[33]

Projected Average Daily Traffic (ADT): 100 or more vehicles fueled per day. The projection for the number of vehicle trips a RGO can expect may be estimated using information published by the Institute of Transportation Engineers. The vehicular traffic at an RGO is a good determinant for the quantity of storm water pollutants generated at the site. RGOs in Oregon and Washington are subject to two tiers of threshold for treatment of storm water, the first based on the impervious area threshold, and an additional tier storm water treatment requirement for sites that expect 100 vehicles or more ADT per 1,000 square feet of gross building area. [34]

Projected volume of gasoline sale: 25,000 gallons or more of gasoline sale per month. [35] The projected volume of gasoline sales is directly correlated with vehicular trips. 25,000 gallons of gasoline sale per month is equivalent to an average daily traffic of about 100 vehicles.[36]

---

[32] See 'Results of a Retail Gasoline Outlet and Commercial Parking Lot Storm Water Runoff Study (1994)', Western States Petroleum Association, and American Petroleum Institute, 49 p. Commercial parking lots 5,000 square feet or more are presently subject to the SUSMP numerical mitigation standard.

[33] WSPA represents companies that explore, produce, refine, transport and market petroleum in six western states including Oregon, Washington, and California. See www.wspa.org

[34] See, Storm Water Management Manual (August 2000), City of Portland, Oregon, (p 9-10) additional thresholds for fuel dispensing facilities. Also, Storm Water Management Manual for Western Washington, Vol. V, Runoff Treatment BMPs, Washington Department of Ecology, p 9-10, additional requirement thresholds for high-use sites.

[35] The average volume of gasoline sales at a RGO in California is approximately 100,000 gallons per month. Gasoline stations with outputs of 200,000 or more gallons a month are considered high output facilities by the industry.

Although other criteria such as the number of fueling dispensers ("nozzles"-4 or more) and the number of dispenser meters (12 or more assuming one meter per octane grade), were considered for thresholds, the relationship of such criteria to predict the potential for pollutant generation at RGOs is less direct.

It is recommended that numerical mitigation standards be made applicable, if the RGO development meets the following thresholds, (i) creates 5,000 square feet or more of impervious surface; and (ii) has a projected trip generation of 100 or more motor vehicles ADT.

Conclusion

RGOs have been well documented in the scientific literature as significant sources of storm water pollutants. These pollutants such as heavy metals and PAHs have been know to cause the impairment of beneficial uses in receiving waters. As a source of pollutants, storm water from RGOs is similar to runoff from driveways, roads, highways and parking lots.

In order to reduce the discharge of pollutants in storm water to the MS4, it is technically appropriate to require that new RGOs and significantly redeveloped RGOs be subject to the SUSMP numerical mitigation criteria. RGOs in other Western U.S. States already comply with higher numerical mitigation standards than those established by the LA Regional Board and the SD Regional Board. The treatment of storm water for RGOs is technically feasible, safe, and of reasonable cost.

[36] A typical "full" tank gas refueling is around 8 gallons delivered at a pump. Many RGOs use this benchmark for discount offerings or other type of incentives associated with refueling. 100 cars x 8 gallons per car x 30 days = 24,000 gallons of gasoline per month.

Table 1. Characterization of Pollutant Concentrations in the OGS Water Column: Effect of Land-Use Condition (Mean Values)[37]

Mr. Dennis Dickerson
Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013-1105

Dear Mr. Dickerson:

CITY OF LOS ANGELES ADDITIONAL REVIEW COMMENTS ON THE FIRST DRAFT OF THE 2001 LOS ANGELES COUNTY MUNICIPAL STORM WATER NPDES PERMIT

We are transmitting the attached additional comments on the first draft of the 2001 Los Angeles County Municipal Storm Water National Pollutant Discharge Elimination System Permit. These comments deal with issues that are governed by official policies of the City of Los Angeles and are impacted by the draft Permit.

As we noted when we submitted comments on technical issues on May 16, 2001, any official position of the City of Los Angeles with respect to legislation, rules, regulations or policies proposed to or pending before a local, state, or federal governmental body or agency must first be adopted in the form of a resolution by the City Council with the concurrence of the Mayor. Attached please find the City's position on the draft Permit with supporting documentation.

Once again, the City appreciates that the Regional Board will give due consideration to incorporating the City's comments into the final Permit.

R0003124

If you have any questions, please contact me at (213) 473-7999 or Gary Lee Moore, of my staff, at (213) 847-6346.

Sincerely,

James F. Langley for

CITY OF LOS ANGELES

INTER-DEPARTMENTAL CORRESPONDENCE

DATE: June 18, 2001

TO: Councilmember Mark Ridley-Thomas, Chair
Environmental Quality and Waste Management Committee

FROM: Ronald F. Deaton
Chief Legislative Analyst

William T. Fujioka, Director
Office of Administrative and Research Services

SUBJECT: POLICY ISSUES RELATED TO THE DRAFT 2001 NATIONAL POLLUTION DISCHARGE ELIMINATION SYSTEM (NPDES) MUNICIPAL STORMWATER PERMIT

BACKGROUND: The Los Angeles Regional Water Quality Control Board (Regional Board) recently issued a draft 2001 NPDES Municipal Stormwater Permit for review and comment. The NPDES permit is reissued every five years and the existing permit expires on July 31, 2001. This permit identifies the waste discharge requirements for municipal storm water and urban runoff discharges within the County of Los Angeles and the incorporated cities (except Long Beach and Santa Clarita). The County of Los Angeles is the principal permittee and the City of Los Angeles and 82 other jurisdictions are co-permittees.

A Council Motion regarding the 2001 NPDES Municipal Stormwater Permit was introduced on May 18, 2001 (CF#01-1020). This motion directed the CLA and OARS to prepare a report for the Environmental Quality and Waste Management Committee on various policy implications of the draft 2001 NPDES permit.

The deadline for the receipt of comments was May 16, 2001. City staff prepared and submitted technical comments to the Regional Board on that date (see attached). There were, however, several substantive policy issues associated with the proposed permit. In light of the new charter, which states that any official position of the City of Los Angeles with respect to pending agency regulations must have first been adopted in the form of a Resolution by the City Council with the concurrence of the Mayor, this report has been prepared.

The Regional Board has issued a schedule that states that there will be two more draft permits; a second draft of the permit will be issued on June 29, 2001 and a final draft will be issued on September 6, 2001. The proposed adoption date by the Regional Board is scheduled for October 25, 2001.

ANALYSIS: The proposed permit contains the following major new requirements for cities:

1. Public Agency Activities

Proposed Permit – Stormwater runoff from urban streets is a contributing factor in the contamination of coastal waters and beaches. Pollutants, litter and debris on city streets enter the storm drain system and are channeled directly to the ocean. Street sweeping has been identified as a best management practice to reduce storm water pollution. The proposed permit contains language that would require all jurisdictions to conduct bi-weekly street sweeping. The Regional Board's fact sheet states that the change in frequency for street sweeping has been included to be consistent with the Ventura County Municipal Storm Water Discharge Permit.

Current Practice - The existing permit requires a municipality to implement a street sweeping program that sweeps the streets at least monthly, and where feasible, more frequently in areas generating significant refuse. The Bureau of Street Services sweeps approximately 40% of the City's 13,100 curb miles of paved dedicated streets weekly and the remainder once a month. In commercial areas where persistent litter is a problem, the streets are swept weekly or daily. The annual current cost for the street sweeping activities is approximately $7.5 million of which $4.9 is paid from the Stormwater Pollution Abatement Fund (SPAF). The current discretion given to municipalities allows the City of Los Angeles to provide street sweeping services more frequently in areas that generate more debris and less sweeping in areas that are less populated.

Impact on City - Staff estimates that bi-weekly street sweeping will increase the City's cost by an additional $4.6 million annually, $3.6 million in staff costs and $985,334 in expense costs. Additionally, a one-time capital cost for the purchase of additional street sweeping equipment is estimated at around $7 million. The cost to the ratepayer would be an additional charge of $4 a year for the annual costs alone, and the average residential Stormwater Pollution Abatement Charge would need to increase from $23 to $27 a year. This would increase another $7 or more if the equipment was purchased with SPAF funds. Moreover, the South Coast Air Quality Management District's fleet rules require the City to replace its street sweepers with ones that use alternative fuels when new equipment is purchased. The cost of new and upgraded facilities for natural gas sweepers has not been estimated at this time, however, it is expected to be substantial.

The proposed permit states that the increased street sweeping requirement apply until the implementation of a trash total maximum daily load (TMDL) program, which is currently under development for the Los Angeles River and Ballona Creek. Compliance with the trash TMDL will require the City to develop a plan to reduce trash in the waterways by the implementation of new structural devices to capture litter before it reaches the waterways. Although difficult to estimate, capital and operation/maintenance cost estimates are in the neighborhood of $900 million for full capture devices. The proposed permit would require the City to spend millions of dollars to implement bi-weekly street sweeping, which will be necessary only until the trash TMDL is finalized.

Recommended City Position – Delete the requirement for bi-weekly street sweeping.

2. Programs for industrial/commercial inspections

Proposed Permit - The proposed permit includes language that would require the City to move from educational visits to site inspections and require the City to inspect all industrial commercial sites under the Regional Board's jurisdiction, in addition to the City's jurisdiction. Additionally, the proposed permit would add categories of industrial and commercial businesses within the City, almost doubling the list from 13,000 to 23,000 businesses. The required inspections would involve a thorough review of the physical structure and layout of the business, as well as a review of their common practices. It is estimated that, depending on the type of business, the new inspections would average two hours, not including expected follow-up visits, which may be necessary for a majority of the businesses.

Current Practice - The existing NPDES permit requires the City to conduct educational site visits, which are typically brief in duration. Staff activities are limited to distributing brochures and other informational handouts.

Impact on City - Staff supports moving from site visits to full inspections of industrial/commercial sites. This will allow the City to thoroughly review industrial/commercial stormwater impacts and begin enforcement actions on violators. Additionally, staff is supportive of increasing the number of industrial/commercial sites that are under the jurisdiction of the permittees. It is estimated that an additional two new inspectors would be necessary to fulfill the new NPDES requirements to inspect industrial/commercial sites under the City's jurisdiction, which would cost $175,081 per year. Additional attorney costs for anticipated legal actions, which are difficult to estimate, may also be necessary. The SPAF anticipated some additional costs associated with the proposed NPDES permit and included $530,000 in the 2001-02 budget (See Table 1).

The proposed permit, however, also assigns the responsibility for industrial/commercial inspections currently under the Regional Board's jurisdiction to the City. The Regional Board receives permit fees from between $250 and $500 from General Industrial Activities Stormwater Permits for their industrial/commercial inspections. Staff strongly opposes the requirements of the draft permit that passes these responsibilities to the City. These responsibilities clearly belong to and should remain with the Regional Board. Staff estimates that an additional four new inspectors, beyond the previously mentioned two inspectors, would be necessary to carry out this requirement, at a cost of $350,000 per year.

Recommended City Position – Support the Regional Board's responsibility for inspections of industrial/commercial sites that are under their General Industrial Activities Stormwater Permit.

3. Standard Urban Storm Water Mitigation Plans (SUSMPs)

Proposed Permit – Include administrative projects in the SUSMP project categories.

Current Practice - on January 25, 2000, the City Council adopted a policy position that endorsed, in concept, the SUSMP requirement for developments as proposed by the Regional

Board. The Regional Board's proposal included discretionary and ministerial (administratively approved) projects. Although the SUSMP requirements ultimately adopted by the State Water Resources Control Board (State Board) for the current NPDES permit apply only to discretionary projects, the Regional Board has the authority to add ministerial projects when the NPDES permit is re-issued. As a result, the draft NPDES permit expands this section to include ministerial projects.

Impact on City - The inclusion of ministerial projects in the draft NPDES permit for SUSMP project categories is estimated to require four additional staff at a cost of $432,779. The Stormwater Pollution Abatement Fund (SPAF) anticipated some additional costs associated with the proposed NPDES permit and included $530,000 in the SPAF 2001-02 budget (see Table 1).

Recommended City Position – Support the requirements for Standard Urban Storm Water Mitigation Plans (SUSMP).

4. **Implement Requirements for Peak Flow Control.**

Proposed Permit – The proposed permit requires all development that drains to soft-bottom channels, including the entire upper Los Angeles River region (the San Fernando Valley), to show that a post-development peak runoff discharge rate does not exceed the pre-development runoff discharge rate.

Current Practice – The current peak flow control requirements are implemented as part of the existing SUSMP requirements imposed through the CEQA review process. This condition is applicable to the SUSMP project categories where developments will result in increased potential for downstream erosion. It is applied to only developments that have site runoff discharge ***directly*** to soft-bottom channels.

Impact on City - Typical peak flow control measures include detention, retention, or infiltration systems. These measures, however, are limited for new developments in the San Fernando Valley, due to the Watermaster's restriction against any infiltration systems. Staff prepared a sample peak flow calculation, assuming the need for detention/retention, which resulted in a system the size of an average swimming pool for a one-acre development. If this example is accurate, the need for additional open spaces for detention, retention and infiltration systems will severely constrain development in the San Fernando Valley.

Recommended City Position – Since this requirement is not defined in detail and may have significant impact, staff recommends the Peak Flow Control requirement be deleted until consensus language is developed.

5. **Small Construction Site Requirements.**

Proposed Permit - The proposed permit states that for construction sites of less than one acre, the proposed permit would require the implementation of structural and non-structural BMPs, as well as site inspections.

Current Practice – Under the current permit, for sites less than two acres of disturbed soil, construction projects are required to implement minimum BMPs, which consist of good housekeeping practices. During routine inspections, City inspectors observe practices for compliance with minimum requirements. There are no inspections specifically conducted to look for storm water compliance.

Impact on City - In essence, this proposed requirement would make ***every*** project subject to storm water conditions, which would be over 30,000 projects per year in the City of Los Angeles. "Less than one acre" does not have a lower limit and goes significantly beyond the intent of the upcoming federal stormwater regulations. Many projects less than one acre do not cause an adverse impact on water quality. Those that do not cause an adverse impact are not being regulated at the state or federal level and will not be regulated in the immediate future. If a site that is less than one acre does cause an adverse impact on water quality, then current local, state and/or federal ordinances, laws and regulations give the authority for agencies to take enforcement action.

Staff estimates that an additional eight staff would be necessary to conduct this activity at a cost of approximately $809,456. This would increase the stormwater pollution abatement charge by about a dollar a year for residents.

Recommended City Position – Delete the additional requirements on the City to require structural and non-structural BMPs and site inspections on construction sites less than one acre.

6. **Larger Construction Site Requirements.**

Proposed Permit - For construction sites greater than one acre, the proposed permit would require the review and inspection of BMP implementation plans during construction and a Storm Water Pollution Prevention Plan (SWPPP) on site.

Current Practice - Currently, the City is required to inspect construction sites of two acres and above for compliance with a SWPPP. Should violations be discovered on sites between two and five acres, the City conducts follow-up activities. If the construction project site is five acres or over, the City notifies the Regional Board for follow-up activities. The Regional Board is responsible for issuing State General Construction Permits and conducting follow-up activities for sites five acres and above. Beginning in 2003, however, federal regulations will require the Regional Board issue General Construction Permits for sites one acre and above. The issuance of these permits will allow the Regional Board to collect fees for site inspection activities. As the proposed permit is currently written, however, cities will be required to inspect these sites, while the Regional Board collects the fees. It is more appropriate for the Regional Board to begin this activity in 2003 and fund their work through their permit fees.

Impact on the City – It is estimated that the cost to hire an additional two staff to review and inspect BMP implementation plans and SWPPPs would cost approximately $188,339. This would cost the ratepayers an increase of several cents on their Stormwater Pollution Abatement Charge.

Recommended City Position – Until March 2003, current permit requirements should be maintained, whereby permittees are responsible only for SWPPPs for sites 2-5 acres and after March 2003, require that the Regional Board take responsibility for inspections of construction sites greater than one acre. If the Regional Board is willing to transfer the funding from permit fees to the City for the responsibility of inspection of construction sites greater than one acre, the City may want to reconsider this position.

7. Responsibilities of the Principal Permitee

Proposed Permit - Assigns Los Angeles County, as the Principal Permittee, the responsibility of coordinating permit activities and negotiate NPDES requirements with the Regional Board. The proposed permit identifies the Executive Advisory Committee (EAC) representatives and the County as the agencies who will conduct formal discussions with the Regional Board on behalf of the permitees.

Current Practice – The existing permit does not give a formal role to the EAC.

Impact on the City – The proposed language will not allow the City an independent voice when permit coordinating activities take place. As the largest jurisdiction in the region, it is reasonable to provide a separate, permanent voice to the City of Los Angeles on this body.

Recommended City Position – In addition to the Principal Permittee and the EAC, add the City of Los Angeles as the agencies to conduct formal discussions with the Regional Board on behalf of the permittees.

RECOMMENDATION:

That the Council:

1. Forward the attached policy comment matrix to the Regional Board, which details the City's recommended changes for the draft 2001 NPDES Municipal Stormwater Permit, specifically, the Council's positions to:

2. Request deletion of the requirement for bi-weekly street sweeping;

3. Support the Regional Board's responsibility for inspections of industrial/commercial sites that are under the General Industrial Activities Stormwater Permit;

4. Support the requirements for Standard Urban Storm Water Mitigation Plans (SUSMP);

5. Request deletion of the requirement for peak flow control until consensus language is developed;

6. Request deletion of the additional requirements on City to require structural and non-structural BMPs and inspect construction sites less than one acre;

7. Request that until March 2003, current permit requirements be maintained, whereby the City is responsible only for SWPPPs for sites 2-5 acres and after March 2003, require that the Regional Board take responsibility for inspections of construction sites greater than one acre;

8. Add the City of Los Angeles to the Principal Permittee and the Executive Advisory Committee (EAC) as the agencies to conduct formal discussions with the Regional Board on behalf of the permitees.

FISCAL IMPACT STATEMENT:

The total cost of the proposed permit, as written, would cost the City over $13.4 million (see Table 3). The staff recommendations for the proposed 2001 NPDES Municipal Stormwater Permit will cost a total of $607,860 (see Table 2). This total cost includes additional staff costs of $432,779 for the expanded SUSMP implementation requirements and $175,081 for the addition of two inspectors to conduct expanded industrial/commercial site inspections. Any increase in attorney costs have not been calculated at this time, however, it is not expected to be significant the first year of the permit and may be revisited in future years if costs escalate substantially.

The 2001-02 Stormwater Pollution Abatement Fund included $530,000 for expected new NPDES permit requirements. The estimated staff costs of $607,000 will leave a shortfall of approximately $70,000 in the SPAF for these activities. All of the staff will not be necessary the first year of the NPDES permit implementation. In future years, however, the SPAF was budgeted to absorb an increase of $200,000, which will leave the SPAF short by $400,000 annually for permit implementation activities.

CITY OF LOS ANGELES: BUREAU OF SANITATION, STORMWATER MANAGEMENT PROGRAM
Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Location	Passage	Comments/Recommendations
Page 4,Findings Item 6	"These environmentally sensitive area include . . . Significant Natural Areas, and impaired water bodies listed under Clean Water Act Section 303(d)."	Recommend modifying as follows: "These environmentally sensitive area include . . . Significant Natural Areas, and ~~impaired water bodies listed under Clean Water Act Section 303(d)~~." Impaired water bodies are not necessarily synonymous with environmentally sensitive areas. The City believes that there are separate regulatory provisions to address and deal with impaired water bodies such as the TMDL process, which takes into consideration point and non-point source pollution for these waters
Page 4, Findings Item 7	"The increased volume, increased velocity, and..."	Recommend adding to the end of this sentence: "**in water bodies susceptible to these effects**".
Page 4, Findings Item 7	"Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as 10 percent conversion from natural to impervious surfaces."	Recommend rewording this text as follows because 10% may not be the standard: "Studies have demonstrated that increasing impervious cover can lead to declines in habitat quality and associated biodiversity."
Page 5, Findings Item 11	"Studies indicate that facilities...fueling (automotive...)..."	Delete typographical error in parenthesis (...service facilities0)
Page 8, Findings Item 25	"...These criteria apply to discharges...."	Recommend the sentence be changed: "These apply as ambient criteria for inland surface waters". The current language inaccurately describes the legal requirements. The CTR criteria apply as ambient criteria for surface waters, the criteria do not apply directly to discharges as stated here. Also, the State Implementation Policy (SIP) specifically states in footnote 1 on page 1 that "This Policy does not apply to regulation of storm water discharges."
Page 9, Findings Item 37	"California Water Code (CWC) Section 13263(a) requires that...."	Water Code Section 13263(a), in addition to the requirements listed, requires the Regional Board when setting waste discharge requirements to take into consideration "the provisions of Section 13241 including economic considerations." The Los Angeles Superior Court in the permit appeals for the Los Angeles-Glendale, Tillman, and Burbank Water Reclamation Plants confirmed this requirement in the final Statement of Decision issued on April 4, 2001. This decision is binding on the Regional Board. "...other waste discharges; and the need to prevent nuisance. **,and the provisions of Section A 132 and 1.**"
Page 10, Findings Item 38	"California Water Code (CWC) Section 13370 et seq. Requires...".	Recommend changing "comply" to "**be consistent**...". California operates an in-lieu permitting program, waste discharge requirements must merely "be consistent" with CWA requirements.
Page 10, Findings Item 39	The Regional Board is the...."	Recommend replacement of word "or" with "**for**" in the first sentence.
Page 10, Findings Item 43	"To meet this objective, this Order requires implementation of BMPs intended to reduce pollutants in storm water and urban runoff such that ultimately their discharge will neither cause violations of water quality objectives nor create conditions of nuisance in receiving waters."	Recommend modifying as follows: "To meet this objective, this Order requires implementation of BMPs intended to reduce pollutants in storm water and urban runoff to **the Maximum Extent Practicable (MEP)** such that ultimately their discharge will neither cause violations of water quality objectives nor create conditions of nuisance in receiving waters."

CITY OF LOS ANGELES: BUREAU OF SANITATION, STORMWATER MANAGEMENT PROGRAM
Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Location	Passage	Comments/Recommendations
Page 11, Findings	Add a new finding (presumably between Items #45-47).	Recommend reference to non-chapter 3 CEQA requirements for the adoption of waste discharge requirements. Chapter 1 of CEQA requires the Regional Board explore alternatives and mitigation measures that might cause less impact on the environment than the action/Order proposed. Recommend modyifying as follows: "The action to adopt a NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code Section 21100, et seq.), in accordance with Section 13389 of the California Water Code."
Page 12, Part 1	"Each Permittee shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges are: 1. covered by a separate individual or general NPDES permit for . . ."	Recommend modifying as follows: " ...covered by a separate individual or general NPDES permit, or **granted an exemption by the Regional Board, the Executive Officer, or the State Water Resources Control Board**, for . . ." This modification would maintain the intent of the current Permit and include sources previously granted an exemption from the Regional Board or State Water Resources Control Board.
Page 12, Part 1.2	".... and meet all the conditions specified by the Regional Board Executive Officer (and which must be included in the revised SQMP)..."	We recommend reinstating Part 2, Section II.C.4 (p. 33-34) of Order 96-054, which describes the procedures to obtain additional categories of exemptions.
Page 12, Part 1.2.a	"a) Categories of natural flow: . . ."	Recommend modifying as follows: "a) Categories of natural flow: (1) Natural springs and ~~rising~~ **natural** ground water; . . . Uncontaminated **natural** ground water . . ."
Page 12, Part 1.2.c	Add now reference items.	9) Washing of fire/emergency vehicles; and 10) Potable water sources with appropriate BMP's applied.
Page 12, Part 1.2.c.1 & 2	Discharge Prohibitions: "Reclaimed and potable landscape irrigation runoff;" "Water line flushing of potable water distribution systems;"	Recommend modifying as follows: "Reclaimed and potable landscape irrigation runoff;" "Water line flushing ~~of potable water distribution systems~~;" Line flushing within the system is necessary to protect the health and safety of the public. In some cases, when flushing occurs within the distribution system, chlorination is increased and then the water is dechlorinated. However, during the flush, the water may not be to potable water standards.
Page 13, Part 1.2.c.6	"Dewatering of lakes and decorative fountains;"	Recommend modifying as follows: "Dewatering of lakes, **reservoirs, potable water tanks**, and decorative fountains with appropriate BMPs **applied**;"
Page 13, Part 1.2 Last paragraph	"The Regional Board Executive Officer may add or remove categories of non-stormwater discharges above. Furthermore, in the event that any of the above categories of non-	Recommended modifying as follows: " . . . in the event that any of the above categories of non-stormwater discharges are determined to be a **significant** source of pollutants and **cause an adverse significant impact** . . . the discharge will no

R0003134

Location	Passage	Comments/Recommendations
	stormwater discharges are determined . . . in consideration of anti-degradation policies."	longer be exempt . . ."
Page 13, Part 2	"Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited."	An intro sentence needs to be added that says before paragraph 1, "Except in accordance with this Order." This is an extremely important change to protect from citizen enforcement over an alleged violation of the Receiving Water Limitations.
Page 13, Part 2.1 and 2.2	"1. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited." "2. Discharges from the MS4 of storm water, or non-stormwater, for which a Permittee is responsible shall not cause or contribute to a condition of nuisance."	The Order includes the "cause or contribute to" language taken from 40 CFR §122.44(d), which is arguably not applicable to stormwater discharges as stormwater is regulated under §122.44(k), which allows BMPs where effluent limitations are not feasible. The language should at least be changed to read: "1. Discharges from the MS4 that **are demonstrated to** cause ~~or contribute to~~ the violation of **applicable** water quality standards or water quality objectives are prohibited." "2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible shall not cause ~~or contribute to~~ a condition of nuisance."
Page 13, Part 3	"The Permittee shall comply with the permit through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the Storm Water Quality Management Plan (SQMP) and its components and other requirements of this permit including any modifications. If exceedances of water quality objectives.... by complying with the following procedures."	To protect from enforcement jeopardy, the language must read: "The Permittee shall **be deemed to be in compliance** ~~comply~~ with the requirements of this permit through timely implementation of control measures and other actions to **reduce to the Maximum Extent Practicable** pollutants . . . the Permittee shall **assure attempt to come into** compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:" The current wording is not protective against potential enforcement actions and is not consistent with the SWRCB Policy set forth in Order 99-05.
Page 13, Part 3.a	" a) Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance...The Regional Board may require modifications to the Report."	Remove the "or contributing to" language.
Page 17, Part 3.F.2	"The Principal Permittee shall modify the SQMP to comply with waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Maximum Daily Loads (TMDLs) for impaired water bodies."	Include discussion of the process for that modification and the timeline for compliance, which must include a public review.
Page 18, Part 3.G.1.b and g	Prohibit the discharge of "untreated" runoff.	Modify by adding the word "untreated" for each paragraph as follows: "b) Prohibit the discharge of **untreated** wash waters to the MS4 from the cleaning of gas stations . . . or other automotive facilities." "c) Prohibit the discharge of **untreated** runoff to the MS4 from mobile auto washing, steam cleaning . . ." "e) Prohibit the discharge of **untreated** runoff to the MS4 from storage areas of materials containing grease, oil..." "g) Prohibit the discharge of **untreated** runoff from the washing of toxic materials from paved or unpaved areas to the MS4..."

R0003135

Location	Passage	Comments/Recommendations
		"h) Prohibit washing impervious surfaces in industrial/commercial areas that result in a discharge of **untreated** runoff to..." In the existing permit, paragraphs b & g prohibit the discharge of "untreated" runoff
Page 18, Part 3.G.1.e	"Prohibit the discharge of runoff to the MS4 from storage areas of materials containing..."	Recommend modify as follows: "Prohibit the discharge of runoff to the MS4 from storage areas of materials containing grease, . . . and uncovered receptacles containing hazardous materials **unless such containers are new and unopened** "
Page 18, Part 3.G.1.j	"Prohibit spills, dumping, or disposal of materials into the MS4, other than storm water, such as:"	Recommend modifying as follows: "Prohibit ~~spills~~; dumping; or disposal of materials into the MS4, . . ." Spills are not deliberate, intentional acts whereas dumping and disposal are.
Page 18, Part 3.G.1	Add a new reference item after j).	"Control spills to the maximum extent practicable."
Page 18, Part 3.G.1.j.4	"Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials . . ."	Recommend modifying as follows: "Fuel and chemical wastes, animal wastes, garbage, **and** batteries, and other materials that have potential adverse . . . " "other materials" is overly broad, too open-ended, and redundant with the phrase "such as" that prefaces this subsection.
Page 19, Part 3.G.1.k-p	Paragraphs (k) through (p) are not related to (a) through (j) in that they do not reflect a category of prohibitions or controls.	Recommend adding another appropriate topic heading for items (k) through (p) and renumbering as appropriate.
Page 19, Part 3.G.1.p	"Adopt and implement an agency-specific storm water and urban runoff ordinance or amend an existing one, if necessary, to be able to enforce all requirements of the permit, effective immediately upon the adoption of this Order."	The City is unable to adopt a new or amend a current ordinance immediately upon the adoption of this Order. The City recommends modifying as follows: "Adopt and implement an agency-specific storm water and urban runoff ordinance or amend an existing one, if necessary, to be able to enforce all requirements of the permit, effective immediately upon **9 months after** the adoption of this Order."
Page 19, Part 3.H	"...Permittees to address their programs specifically for that particular situation and change them accordingly to address the problem.)"	Recommend modifying as follows: "...for that particular situation and change them accordingly to address the problem **if continued implementation of the SQMP is not expected to address the situation).**"
Page 20, Part 3.J	"The Principal Permittee shall submit a Storm Water Monitoring Report on August 15, 2002 and annually on August 15 thereafter..."	Although not specifically specified, it appears from this passage that the reporting period for monitoring requirements is based on the fiscal year (July 1 through June 30 of each year) The Storm Water Monitoring Report for this period is then due on August 15, only about six weeks later. This time period is too short to perform thorough assessments and reporting of the vast array of data that will be collected during the year. This report should be due six months after the conclusion of the year's sampling
Page 24. Part 4.A.2. a and 1	Corporate Outreach	The phrase "corporate heads" is too limiting, especially for large corporations whose officers are located out of the areas. Therefore, change "corporate heads" to "**corporate or management company**."

Location	Passage	Comments/Recommendations
Page 24, Part 4.A.2.b	"Permittees shall develop and implement a Business Assistance Program . . . "	Change to "Permittees shall implement a Business Assistance Program..." Permittees may be able to establish cooperative efforts with existing business assistance programs to accomplish this requirement without undue burden of developing a brand new program. It may also be more cost effective for them to partner with other organizations.
Page 24, Part 4.A.2.b.1	"On-site technical assistance or consultation via telephone to identify and implement pollution prevention methods and best management practices"	Recommend the insertion of the word "stormwater" in front of "pollution prevention".
Page 25, Part 4.A.2.b.4	"Permittees shall conduct follow-up independent of the Business Assistance Program, based on the priorities of the Industrial/Commercial Inspection Program"	Move "Permittees shall conduct follow-up independent of the Business Assistance Program, based on the priorities of the Industrial/Commercial Inspection Program" to P. 28 Part B 5. C). The placement of this statement implies that some type of follow-up is required by the Business Assistance Program. After "The Business Assistance Program shall be a confidential and non-enforcement program", add the following: "The Business Assistance Program shall operate independently of the Industrial/Commercial Inspection Program".
Page 27, Part 4.B.3.d	"Other Commercial facilities (contributing or potentially contributing to the impairments of receiving waters)"	We recommend the "other commercial" sites to be defined as follows: Those facilities having activities corresponding to SIC codes 33XX, 34XX, 35XX, 4612, 4613, 4619, 4731, 4783, 4789, 4925, 4932, 5031, 5039, 5051, 5082, 5083, 5084, 5085, 5172, 5211, 5989, 7221, 7212, 7213, 7217, 7218, 7219, 7261, 7622, 7623, 7692, 7693, and 9629.
Page 28, Part 4.B.5.b	"Automotive Service Facilities"	We recommend defining "Automotive Service Facilities" as SIC codes 75XX, and 5014.
Page 28, Part 4.B.7.a	"Each Permittee shall provide oral notification to the Regional Board of non-compliance with existing storm water regulations (within 3 days of discovery) or create an adverse impact or nuisance as it relates to the quality of the receiving waters of the State within its jurisdiction, within 24 hours of the discovery. Such oral notification shall be followed up by a written report to be submitted to the Regional Board within 5 days of the incidence of non-compliance."	Our enforcement staff deals with nuisance discharges almost on a daily basis. These flows are stopped and appropriate enforcement actions are taken. Reporting all incidents would not be practical We recommend reporting only serious discharges of sewage or hazardous material to the RWQCB as detailed in the draft permit language. All other discharges should be reported in writing by the 10th day of each month. Replace passage with, " For discharges to the MS4 of sewage and hazardous materials that are a threat t public health and safety, and the quality of receiving waters, each permittee shall provide verbal notification to the Regional Board of non-compliance within 24 hours of discovery followed by a written report within 5 working days. All other discharges will be reported in writing to the Regional Board by the 10th day of each month.
Page 28, Part 4.B.7.b	"Permittees shall develop and submit criteria by which to evaluate events of non-compliance to determine whether they create an adverse impact or nuisance. These criteria shall be submitted in the SQMP and Annual Report for Regional Board review and subject to Regional Board Executive Officer's approval."	Recommend modifying as follows: "~~Permittees~~ **The Principal Permittee in conjunction with the co-Permittees** shall develop and submit ~~criteria~~ **procedures ~~by which~~** to evaluate . . ."
Page 29, Part 4.C.1	Programs for Development Planning	Recommend modifying as follows: "...require all planning priority development and redevelopment projects, **to the maximum extent practicable,** to,"

R0003137

CITY OF LOS ANGELES: BUREAU OF SANITATION, STORMWATER MANAGEMENT PROGRAM
Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Location	Passage	Comments/Recommendations
Page 29, Part 4.C.1	Programs for Development Planning	Define planning priority projects. Definition must be consistent with the Development Planning Model Program.
Page 29, Part 4.C.1.b	"Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground;"	Recommend modifying as follows: "Maximize the percentage of permeable surfaces to allow percolation of storm water into the ground, **except in the Harbor area and in the San Fernando Valley (SFV), where prior approval by the SFV Watermaster, also known as the Upper Los Angeles River Area (ULARA) Watermaster, is required.**" The Upper Los Angeles River Area (ULARA) Watermaster is concerned with percolation of storm water into the ground in the San Fernando Valley area. The Port of Los Angeles has also expressed concerns r the feasibility in the Harbor area due to the high groundwater table.
Page 29, Part 4.C.1.d	"Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good house keeping practices;"	Recommend deleting this subsection. It is redundant with the SUSMP requirement.
Page 30, Part 4.C.3.a.4 and 5	"Divert roof runoff to vegetated areas before discharge"	This violates section 91.7013.9 of the building code, which requires all roof water be delivered through a non-erosive via gravity to a street or watercourse if the slope of the underlying natural ground exceeds 3% Under Finding #7 (page 4 of the draft permit) the major concern with urban developments in hillside areas is the potential for increase volume and velocity of storm water runoff that will greatly accelerates downstream erosion and impairs stream habitat. This will be true in rural areas where there are no concrete curbs, gutters, or storm drains. Under section 91.7013.9 there will not be any downstream erosion and impairs stream habitat because all the roof drainage will be carried to the City's storm drain system via non-erosive devices. Therefore, it is recommended that item (4), "Divert roof runoff to vegetated areas before discharge" be deleted.
Page 30, Part 4.C.3.b	SUSMP	Since this permit is supposed to consider watershed solutions and that in some cases it may make more sense to develop regional solutions that could address existing as well as new development. The followir change is suggested: After (7) add in the following paragraph: "Or the Permittee shall demonstrate how a watershed solution using regional controls has been developed that would lead to better water quality results than individual new and redevelopment sites meeting the SUSMP standards".
Page 30, Part 4.C.3.b	SUSMP Project Categories	Recommend changing title of item (4) to "Automotive Repair Shops" to be consistent with the definition title on Part 5 of page 46, or vice versa.
Page 31, Part 4.C.4	Numerical Design Criteria	Include "Structural BMPs" in 1st paragraph. The revised paragraph shall read as follows: "The Permittees shall require that post-construction **structural or** treatment control BMPs incorporate..."
Page 31, Part 4.C.4.b.2	"....for Los Angeles County"	Recommended change: "...for Los Angeles County, or"
Page 32, Part 4.C.6	Definition of Acre	Define acre as 43,560.

Location	Passage	Comments/Recommendations
Page 32, Part 4.C.6.a	USEPA Phase II requirements	Change sentence to read as, "One acre or greater..."
Page 34, Part 4.C.10	Mitigation Funding	Please explain what this entire section means. Are subsections a through c identified as potential funding sources? Define items a through c. In item (a), define conditions of impracticability. (Same as existing permit?) Granting of waivers, including waivers of impracticability, shall be the responsibility of the Regional Board Item (b) needs clarification. "'Legislative funds become available"...to who?
Page 35, Part 4.C.12	General Plan Update	Under the State of California General Plan Guidelines, each City is given 5 years to update the General Plan. This item gives each Permittee 540 days from permit adoption date. In order to effect a complete and appropriately detailed update to the General Plan, it is suggested that the time allowed should reflect the State General Plan Guidelines of 5 years. Therefore, change the deadline of 540 days to 5 years from permit adoption date.
Page 35, Part 4.C.14.	Developer Technical Guidance and Information	The City of Los Angeles has developed three technical guidance manuals, which are entitled, "REFERENCE GUIDE FOR STORMWATER BEST MANAGEMENT PRACTICES", "DEVELOPMENT BEST MANAGEMENT PRACTICES HANDBOOK, PART A – CONSTRUCTION ACTIVITIES", AND "DEVELOPMENT BEST MANAGEMENT PRACTICES HANDBOOK, PART B – PLANNING ACTIVITIES". The City's technical manuals already provide such information as identified on Page 35 Part 4C14b1-5 for development projects with the exception of the Peak Flow Control numerical criteria (referred to on Page 29 Part 4C2). The Peak Flow Control numerical criteria will be developed by the Permittees upon the adoption of the Permit as described in Page 29 Part 4C2. If the Board determines that the City's technical manuals are not sufficient to meet the requirements enumerated in Part 4C14, then for the purposes of countywide consistency, the Principal Permittee should develop the technical guidance manual. Recommend modifying as follows: "b) Principal Permittees shall develop...."
Pg. 39, Part 4.E.1	Public Agency Activities	Please revise the listing of Public Agency requirements to be consistent with the succeeding Sections and Topics.
Page 40, Part 4.E.3.a	"Each Permittee shall...from construction activity at all construction sites."	Change sentence to read: Each Permittee shall...from construction activity **activities** at all **public** construction sites.
Page 40, 41		There are two subsections under Part 4.E numbered "3", one on page 40 and one on page 41.
Page 41, Part 4.E.3.b.4 and 5	Public Construction Activities Management	Items 4 and 5 address City staff ensuring effectiveness of BMPs. It has always been the City's contention that staff is not responsible for ensuring BMPs are effective. Staff may be responsible for ensuring BMPs are in place and operational, but should not be liable for "effectiveness."
Page 41, Part 4.E.3.b and c	"Each Permittee shall obtain coverage...under separate permit until March 10, 2003."	Delete b) and c). Replace with "Each Permittee shall comply with Part 4 D of this Order."
Page 41, Part 4.E.3.b	Vehicle Maintenace/Material Storage... "Each Permittee shall implement BMPs to minimize pollutant discharges in storm water..."	Recommend modifying as follows: "Each Permittee shall implement BMPs to minimize pollutant discharges to the maximum extent **practicable** in storm water . . ."

CITY OF LOS ANGELES: BUREAU OF SANITATION, STORMWATER MANAGEMENT PROGRAM
Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Location	Passage	Comments/Recommendations
Page 42, Part 4.E.3.c	"Each Permittee shall require that all vehicle/equipment wash areas..."	Recommend modifying as follows. "...for new facilities or during redevelopment of existing sites **wash areas**."
Page 42, Part 4.E.3.d	"Each Permittee shall, for each municipal yard...obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit"	We would like to maintain the current Permit provisions (Part 2.IV.C.8 of Order 96-054), which allow municipal yards covered under Phase I of the Federal Storm Water Regulations, to seek coverage under the municipal permit.
Page 42, Part 4.E.4.g	"Each Permittee shall regularly inspect storage areas."	Revise to read: "Each Permittee shall regularly annually inspect storage areas."
Page 42, Part 4.E.5.b	"Classify priority catch-basins to be those that are 40 percent full"	Please clarify how the 40 percent full figure came about---is there any science behind it. This figure is very subjective to individual judgement, especially in the field.
Page 43. Part 4.E.5.a	"Inspect and clean catch basins between..."	Change to "Inspect **and if necessary** clean catch basins...."
Page 43. Part 4.E.5. Second b	"A review of current storm drain maintenance...appropriate storm water BMPs are being utilized to water quality;"	Change to ".... appropriate storm water BMPs are being utilized to **protect** water quality;"
Page 44, Part 6.c	"Each Permittee shall require that sawcutting wastes be recovered and disposed of properly and that no case shall waste be allowed to enter the storm drain."	Change paragraph to read:" Each Permittee shall require that sawcutting wastes be recovered and disposed of properly."
Page 44, Part 4.E.7	"Each Permittee shall continue to repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as: earthquakes, . . ."	Recommend modifying as follows: "Each Permittee shall continue to repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as, **but not limited to**: earthquakes, . . ."
Page 44, Part 4.F	"Permittees shall eliminate all illicit connections and illicit discharges to the storm drain, and shall document and report all such cases. To accomplish this, the Permittees shall revise their Program for Elimination of Illicit Connection and Illicit Discharge...including performance measures and schedules."	Does this mean revising the Model Program?
Page 45, Part 4.F.1.a	"Implementation: Upon Executive Officer approval of the revised IC/ID Program...and available for review and approval by the Regional Board when requested."	Does this mean "Upon Executive Officer approval of the revised Model IC/ID Program" ?
Page 45, Part 4.F.1.b	General Elements – "...the Lead Permittee shall have the capability to locate all permitted discharges..."	The term "Lead Permittee" is not defined in the permit. Are we to assume this is the "Principal Permittee?"
Page 46, Part 4.F.3.a	"Respond, within 72 hours of discovery or a report of a suspected illicit discharge, with activities ..."	It is our recommendation that the response time be changed to three (3) business days instead of 72 hours.

CITY OF LOS ANGELES: BUREAU OF SANITATION, STORMWATER MANAGEMENT PROGRAM
Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Location	Passage	Comments/Recommendations
Page 48	"Environmentally Sensitive Areas"	"...Natural Area by the California Department of Fish and Game... or Endangered Species (RARE) beneficial use~~; or an area identified by the Permittees as environmentally sensitive for water quality purposes, based on the Regional Board Basin Plan and Clean Water Act Section 303(d) Impaired Water-bodies List for Los Angeles County~~."
Page 51	Definitions	Add new term, "Pollution Prevention" and definition, which emphasizes source reduction methods for reduction and elimination of pollutants entering stormwater. The restricted definition will more clearly define what is being required of the regulated community and what is being enforced by regulators. If undefined, the term will default to include multi-media source reduction, in process recycling, conservation of energy and natural resources.
Page 57, Item F Page 59, Item L	Proper Maintenance and Operation Bypass	These requirements seem to have been copied from an NPDES permit for a wastewater treatment plant. They are not applicable to a stormwater permit. "Facilities and systems of treatment" have not even been proven to be effective. How can it be that the non-operation or bypassing of such facilities can be deemed harmful or non-compliant? Please ensure that these sections are deleted.
Page 73, Monitoring and Reporting Program, IIC1	"The Principal Permittee shall develop and implement a tributary/source identification monitoring program."	The RWQCB should have more mass emission sites up each of the 5 major watersheds instead of just measuring concentration in various tributaries. Data from each of these proposed mass emission stations represents the contribution from the next upstream mass emission station and all the ancillary storm drain contributions. Watershed-based source control should be targeted in the proposed mass emission reaches that contribute the most pollutant of concern. If the RWQCB still wants to have these tributary stations, then flow should be added to the requirements so that the different tributaries could be compared to each other based on pollutant loads.
Page 75, Monitoring and Reporting Program, IIE2	" Reference stations shall be selected in stream reaches that are not listed as impaired on the 303(d) list and that are not representative of urban stream conditions, based on surrounding land uses and a lack of upstream point source discharges."	These reference stations will be difficult to find and are probably not comparable to the more urban downstream reaches.

R0003141

TABLE 1

SPECIAL PURPOSE FUND SCHEDULES

SCHEDULE 7

STORMWATER POLLUTION ABATEMENT FUND

The Water Quality Act of 1987, adding Section 402(P) to the Federal Water Pollution Control Act, provides that the Environmental Protection Agency shall establish regulations setting forth requirements for stormwater discharges from large municipal storm drain systems. The City enacted a Stormwater Pollution Abatement Charge (Article 4.2 of Chapter 6 of the Los Angeles Municipal Code) on all properties in the City in order to treat and abate stormwater. The charge is based on stormwater runoff and pollutant loading associated with property size and land use.

Actual 1999-00	Estimated 2000-01		Budget 2001-02
		REVENUE	
$ 6,302,128	$ 12,035,806	Cash Balance, July 1	$ 12,225,806
		Less:

General Services Inter-Departmental Expense: Estimated annual costs for General Services for fuel, maintenance (labor and materials) related to additional sweepers, trucks, and loaders.*							$985,334
Total Annual Cost:							**$6,377,614**

Capital costs for purchase of equipment for Bureau of Street Services to perform additional street sweeping (24 Compressed Natural Gas (CNG) powered motor sweepers, 3 Tractors, 1 Pushback Trailer, 3 Lt. Over-the-cab-Loaders, and 6-HD Over-the-cab Loaders).	$7,065,000
Total Capital Cost:	**$7,065,000**

Total Costs, Annual and Capital:	**$13,442,614**

* The cost of facilities for the CNG powered equipment has not been estimated at this time. Additional overnight parking for the equipment may be required at the Northridge Facility.

GENERAL NOTE: This cost estimate does not include costs related to implementing TMDLs.

R0003144

Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Policy Issues

Location	Passage	Comments/Recommendations
General Comment	The City strongly opposes the requirements of the draft Permit that pass responsibilities of the State to the Permittees for the inspection of industrial/commercial sites and construction sites. We are pleased to hear that the Executive Officer has taken the same position as the City against the proposed transfer of responsibilities. These responsibilities clearly belong to and should remain with the State and the Regional Water Quality Control Board. Specifically, for: Industrial/Commercial Sites: Inspections would include Phase I facilities that operate under NPDES permits issued by the Regional Board. Shifting responsibilities for inspections will put the Permittees in the position of acting as agents of the State, create significant financial burdens for the Permittees, and expose the facilities to being regulated at both the State and local levels. This will create situations where inconsistencies in the interpretation and application of regulations can double the potential liability of a given facility. Construction Sites: a) Less than 1 acre - Regulations for sites less than 1 acre are unnecessary. "Less than 1 acre" does not have a lower limit and is beyond the intent of the Federal Phase II program. Many projects less than 1 acre do not cause an adverse impact on water quality; those that do not cause an adverse impact are not being regulated at the State or Federal level and will not be regulated in the immediate future. If a site that is less than 1 acre does cause an adverse impact on water quality, then current local, State and/or Federal ordinances/laws/regulations give the authority for agencies to take enforcement action. b) Between 1 and 5 acres - Federal regulations (Phase II) for sites 1 acre and greater will be in effect beginning March 2003. Therefore, increases in regulations for sites 1 - 5 acres should be deferred until that time, when the State will modify its General Construction Permit to include these sites and take on the responsibilities to inspect them. Until March 2003, current Permit requirements should be maintained, whereby Permittees are responsible only for Local SWPPPs for sites 2 - 5 acres. c) Five or more acres - Regulating these sites belongs with the State under the Statewide General Construction program.	
Page 10, Findings Item 39	"These industrial and construction sites and discharges are also regulated under local laws and regulations."	The responsibilities for State General Industrial and General Construction Permits should remain with the State (please reference General Comment above). Recommend modifying as follows: "These industrial and construction sites and discharges are also can also be regulated under local laws and regulations."
Page 10, Findings Item 41	"A ministerial project may be made discretionary by adopting local ordinance provisions that create decision-making discretion."	The California CEQA defines which projects require discretionary actions. A ministerial project cannot be made discretionary by adopting local ordinance. Any modifications and/or additions to CEQA must be done at the state level. Recommend deleting this sentence.
Page 14, Part 3.A.1	Second paragraph, second sentence: " However, the Principal Permittee..."	Recommend changing the language to "However, the Principal Permittee, the City of Los Angeles, and five representatives of the Watershed Management Committees designated by the Executive Advisory Committee (EAC) will conduct formal discussions with the Regional Board on behalf of the Permittees."

Location	Passage	Comments/Recommendations
Page 19, Part 3.G.1.m and n	"m) Control the contribution, or potential contribution..." "n) Carry out all inspection, surveillance..."	These paragraphs overlap the responsibilities of the State-wide General Storm Water Permits associated with Industrial Activities and Construction Activities. Recommend modifying as follows: "m) ...discharges of storm water runoff associated with industrial activities (including construction activities) not already covered by the State General Industrial Activities Storm Water Permit or the State General Construction Activities Storm Water Permit to its MS4... " "n) ...and require regular reports from industrial facilities, not already covered by the State General Industrial Activities Storm Water Permit, discharging..."
Page 23, Part 4.A.1.d	"Each Permittee shall provide all School Districts within its jurisdiction with materials, including videos, live presentations, brochures, and other media necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution."	Revise to read: "~~Each~~ The Principal Permittee in cooperation and coordination with the other Permittees shall provide all School Districts within its their jurisdiction with materials, including ~~videos~~, live presentations with visual media, brochures, and other media necessary to educate a minimum of 50 percent of all school children (Grades K-12) every 2 years on storm water pollution."
Page 25 Part 4.B	6th Bullet "Enforcement of Pollution Prevention and enforcement control measures at Industrial/Commercial sites."	Change to "~~Enforcement~~ The implementation of proper stormwater Pollution Prevention source reduction and control measures at Industrial/Commercial sites".
Page 26, Part 4.B.3.a	NEW: ""All industrial groups regulated under Phase I..."	NEW: In accordance with the General Comment on Page 1, this item should be deleted.
Page 26, Part 4.B.3.c	"Restaurants. The County Health Department Code shall be amended to facilitate compliance with this Order. At a minimum, the Code shall be modified to require inspections for ..."	The passage appears to imply assigning County Health inspectors the task of inspecting restaurants for BMPs. It is our recommendation that a more direct sentence be added. For example, "Restaurant. The Principal Permittee shall inspect restaurants and other food establishments to ensure compliance with this Order, and the County Health Department Code shall be amended to facilitate the implementation of this requirement."

Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Policy Issues

Location	Passage	Comments/Recommendations
Page 26-28, Part 4.B.2 & 5	"Source Identification (Industrial/Commercial Sites)"	In accordance with the General Comment on page 1, the Permittees are responsible for the updating of their data bases and the Regional Board is responsible for maintaining its data base. This item should be deleted. Facilities that are already covered under both the General Industrial and Construction permits should not also be covered under the Municipal permit. Inspection and BMP requirements for these permits should remain the responsibility primarily of the RWQCB.
Page 27, Part 4.B.4.a	"Each Permittee shall implement, or require the implementation of, the designated minimum BMPs, as approved in Resolution No. 98-08, at each industrial/commercial site within its jurisdiction."	Please reference General Comment, located at the top of Page 1 Recommend modifying as follows: "Each Permittee shall implement, or require the implementation of, the designated minimum BMPs, as approved in Resolution No. 98-08, at each industrial/commercial site, other than those facilities that have a State General Industrial Activities Storm Water Permit, within its jurisdiction."
Page 27, Part 4.B.4.b	"Each Permittee shall implement, or require implementation of, additional controls for Industrial/Commercial sites tributary to Clean Water Act section 303(d) water bodies (where a site discharges pollutants for which the water body is impaired) as necessary to comply with this Order. Each Permittee shall implement, or require implementation of, additional controls for Industrial/Commercial sites within or directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas as necessary to comply with this Order."	Please reference General Comment, located at the top of Page 1. Recommend modifying first half of Part 4.B.4.b as follows: "Each Permittee shall implement . . . for Industrial/Commercial sites, other than those facilities that have a State General Industrial Activities Storm Water Permit, tributary to Clean Water Act . . . " Recommend separating and modifying second half of Part 4.B.4.b into Part 4.B.4.c as follows: "c) Each Permittee shall implement, or require implementation of, additional controls for Industrial/Commercial sites, other than those facilities that have a State General Industrial Activities Storm Water Permit, within or directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas as necessary to comply with this Order."
Page 27, Part 4.B.5.a	"Each Permittee shall conduct Industrial site inspections..."	In accordance with the General Comment on page 1, we recommend that Item 5a be modified by the addition of the following: "other than those facilities that have a State General Industrial Activities Storm Water Permit."

Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Policy Issues

Location	Passage	Comments/Recommendations
Page 27, Part 4.B.5.b	"Each Permittee shall establish inspection frequencies for facilities...	In accordance with the General Comment on page1 and the revised Part 4.B.3.a we recommend that the 4th row of the table be deleted. The following inspection schedule is recommended: 1. Automotive Facilities – twice during the permit cycle. 2. Industrial/Commercial – once during the permit for all; second visit to those with exposure. 3. Restaurants – will be done by Principal Permittee.
Page 28, Part 4.B.5.b	Table	Add asterisk to "other commercial" in the table.
Page 28, Part 4.B.5.d	"To the extent that Regional Board staff has conducted an inspection of an Industrial/Commercial site during a particular year, the requirement for the responsible Permittee to inspect this site during the same year will be satisfied."	In accordance with the General Comment on page 1, this item should be deleted.
Page 29, Part 4.C.2	Peak Flow Control	This item requires that all projects, regardless of size or types, must show that the post-development peak discharge rate must not exceed the pre-development rate. This will cause undue hardship for developments, particularly in the Upper Los Angeles River Area where there is limited open space for detention/retention. Typical peak flow control measures include detention, retention, or infiltration systems. In addition, the Upper Los Angeles River Area (ULARA) Watermaster is concerned with potential ground water contamination from stormwater infiltration in the San Fernando Valley and will not allow any infiltration systems. The result can be a limit on or stopping new developments in the Upper LA River Area (See Exhibit 1). In addition, the Principal Permittee needs to be involved to ensure countywide consistency. We are also unclear as to what peak flows are intended to be controlled. For estimating purposes, we calculated the amount of runoff generated by 0.75 inch of rainfall on a 1-acre apartment building development. It was assumed that the site was 100% pervious prior to development and 90% impervious after development. Calculations show that the amount of runoff would increase by approximately 16,700 gallons, which would require a capture system with a capacity equivalent to an average-sized (15 ft. x 23 ft. x 6 ft.) residential swimming pool. If this assumption is correct, then the capture system for bigger sites would be several times larger than one swimming pool. Therefore, the need for additional open space for capture systems will put severe constraints on new developments and place an onerous burden on developers that may result in reducing the number of development projects.

Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Policy Issues

Location	Passage	Comments/Recommendations
		Since this requirement is not defined in detail and may have significant impact, we recommend the Peak Flow Control requirement be deleted until consensus language is developed.
Page 30, Part 4.C.2.e	"Soft-bottom segments of other receiving waters within Los Angeles County"	Replace phrase to read as, "unlined reaches of streams, creeks or rivers within Los Angeles County." This is consistent with Xavier Swamikannu of LARWQCB in his description of natural fresh water streams. (Need to attach map that shows which reaches are soft-bottom segments)
Page 32, Part 4.C.5	"Applicability of Numerical Design Criteria"	Change item (a) to read as follows: "Single-family hillside home developments that result in the creation of 10,000 square feet or more of impervious surface area." Change item (c) to read as follows: "Industrial/Commercial developments that result in the creation of 100,000 square feet or more of impervious surface area." Change item (d) to "Automotive Repair Shops" The criteria specified for retail gasoline outlets in item (e) should be required and not suggested. However, remove the 2 criteria where values are projected. The revised sentence should read as follows: "Retail gasoline outlets with six or more fueling dispensers, or with 24 or more dispensing meters, or 5,000 square feet or more of impervious surface area." For restaurants in item (f) change to "5,000 square feet or more of impervious surface area."
Page 32-33, Part 4.C.7.a.1-8	"Site Specific Mitigation"	These added categories have gone beyond the scope of Phase II. In addition, many of these categories are being dealt with in other regulations. The federal regulation for stormwater is to control pollutants via application of BMPs to the MEP if the discharge is a significant pollutant source that creates an adverse impact to the environment, an individual NPDES permit is required and it is no longer regulated by the Municipal permit. The City recommends that these categories be removed and allow the other regulations already set such as the Federal Phase I and Phase II programs to regulate these sites.
Page 33, Part 4.C.8	"Redevelopment Projects" "Significant redevelopment means the creation or addition or replacement of 5,000 square feet of impervious surface area on an already	Delete the term "replacement" because replacement should not trigger SUSMP requirements. It is not consistent with the text in the SUSMP Board Order and will significantly increase redevelopment costs, and impede redevelopment. Economic Impacts should be evaluated and taken into account

Location	Passage	Comments/Recommendations
-	developed site."	
Pages 36-39, Part 4.D	"Programs for Construction Sites"	Modify the text in this section in accordance with the General Comment on page 1. The General Construction Activities Storm Water Permit (GCASP) and the General Industrial Activities Storm Water Permit (GIASP) should be referenced in this Municipal permit, not restated or modified by this municipal permit. These activities are already regulated under the respective permits and should not be additionally regulated under the Municipal NPDES Permit.
Page 36, Part 4.D	"D. Programs for Construction Sites"	Add Exempt Projects in the categories of construction: Permittees may exempt certain types of Development Construction Projects from the program that pose a minimum risk of storm water pollution. These projects are exempt from any storm water construction control measures including the minimum BMP requirements. A specific listing of exempt projects is included in this section. Additional exemptions may be determined by the Permittee and shall be provided to the Regional Board with a justification for their designation (for purposes of notification). A list of specific types of Development Construction Projects that are deemed to be exempt include: • Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility; • Emergency construction activities required to immediately protect public health and safety; • Interior remodeling with no outside exposure of construction materials or construction waste to storm water; • Mechanical permit work; • Electrical permit work; • Sign permit work. Other types of Development Construction projects may be designated as exempt if all three of the following criteria are met: • No significant soil disturbing activity (unless adequate controls are provided); • No outside storage or exposure to storm water of construction materials or construction wastes (unless adequate controls are provided); and • The activity poses a minimal risk of storm water pollution. •
Page 36, Part 4.D.a, b, c	"D. Programs for Construction Sites"	Modify the text in this section in accordance with the General Comment on page 1. Additionally, it should be clearly stated that the three size categories of the construction

Location	Passage	Comments/Recommendations
R0003151		sites refer to areas of disturbed soil. For example, 5 or more acres means a construction site with 5 or more acres of disturbed soil. Otherwise the specified designations will encompass ALL projects, including projects where only interior work is involved with no outside exposure of materials, or others such as mechanical/electrical permit work. These types of projects do not have any impact to storm water pollution and should be exempted from the requirements of this permit. Hence, a category for exempted projects should be included for these activities that are determined to have no potential significant effect on storm water quality to include emergency activities required for public safety and routine maintenance to maintain original grade line or hydraulic capacity. Include a category for exempt projects and change the categories to read as follows: Construction sites with 5 or more acres of disturbed soil Construction sites with 1 to 5 acres of disturbed soil Construction sites with less than 1 acre of disturbed soil Exempt Projects
Page 36, Part 4.D.1	"For construction sites less than 1 acre...."	Modify the text in this section in accordance with the General Comment on page 1. Change title to read, "For construction sites with less than 1 acre of disturbed soil..." Most of the projects under this category of construction sites with one acre or less of disturbed soil have minimum, if any, impact to storm water pollution. With limited resources, we should focus on construction sites with one acre or greater of disturbed soil for BMP implementation that have greater impact on storm water pollution. The section Part 4D1c-bulleted items are not consistent with the Model Program. Therefore, section 4D1c should be remove in its entirety and replaced with a minimum set of requirements in accordance with the Model Program.
Page 36, Part 4.D.1.b	"Train employees in targeted positions . . . (180 days from adoption of this Order), and . ."	Sufficient time should be allowed for the accomplishment of the training requirements following the revised Construction Development Program in the SQMP. Recommend revising Part 4.D.1.b to read as follows: "Train employees in targeted positions . . . (one (1) year from adoption of the Order), and . . . "
Page 37, Part 4.D.2	"For construction sites one acre and greater..."	Modify the text in this section in accordance with the General Comment on page 1. Recommend changing the 1st paragraph to read as follows: "For construction sites with one acre or more of disturbed soil and greater, each Permittee shall require that in addition to the requirements of D.1 above, and require the preparation, submittal, and

Policy Issues

Location	Passage	Comments/Recommendations
		implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP).
Page 37, Part 4.D.2.a	"Will result in soil disturbance of one acre or more in size;"	Change the phrase to read, "Will result in one acre or more of disturbed soil..."
Page 37, Part 4.D.2.e	"No construction-related materials, wastes..."	Recommend modifying as follows: "~~No c~~Construction-related materials, wastes, spills, ~~or~~ and residues shall be ~~discharged from the project site to streets, drainage facilities or adjacent properties by wind or runoff~~ kept onsite to the maximum extent practicable;"
Page 37, Part 4.D.2.d-g	"In addition, each Permittee shall ensure the following minimum requirements are effectively implemented at all construction sites regardless of size: d, e, f, g"	Recommend moving Parts 4.D.2.d-g to follow immediately after Part 4.D.1 because Part 4.D.4, the category for construction sites of five acres and greater, refers to the requirements of Part 4.D.1, not Part 4.D.2. Recommend modifying as follows: "d) Sediments generated on the project site shall be retained ~~using adequate structural drainage controls~~ onsite to the maximum extent practicable;"
Page 37, Part 4.D.2.f	"Non-storm water runoff from equipment and vehicle washing and any other activity shall be . . ."	Recommend modifying as follows: "Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at ~~the project site~~ and treated before discharge and/or contained and hauled off site to an approved disposal facility; and"
Page 37, Part 4.D.2.g	"Erosion from slopes and channels will be prevented by implementing BMPs including, but not limited to: . . ."	Recommend modifying as follows: . . . BMPs ~~including, but not limited~~ to such as: limiting of grading... and covering erosion susceptible slopes."
Page 38, Part 4.D.2 (after g)	"The landowner shall sign a statement to the effect:"	Recommend modifying as follows: "The landowner or agent of the landowner shall sign a statement to the effect"
Page 38-39, Part 4.D.3	For sites one acre and greater...	Recommend modifying sentence to read as follows: "For construction sites with one acre of disturbed soil and greater, each Permittee shall inspect..." Modify the text in this section in accordance with the General Comment on page 1.
Page 39, Part 4.D.4	"For sites 5 acres and greater, . . ."	Recommend modifying as follows: "For construction sites with 5 acres and greater of disturbed soil, each Permittee shall require that the conditions in D.1 above and:" Modify the text in this section in accordance with the General Comment on page 1.

Comments on the First Draft of the 2001 NPDES Municipal Stormwater Permit

Policy Issues

Location	Passage	Comments/Recommendations
Page 39, Part 4.D.4.a	"On March 10, 2003, for sites one acre and greater, each Permittee..."	Change the sentence to read, "On March 10, 2003, for sites one acre and greater of disturbed soil, each Permittee..." Modify the text in this sectidn in accordance with the General Comment on page 1.
Page 40, Part 4.E.3.b	"Each Permittee shall comply with requirements 1,2, and 3 in the Construction...at all public construction sites:"	Paragraph should read:" Each Permittee shall comply with requirements of D.1, D.2, and D.3 (Page 36-39) in the Construction...at all public construction sites:" Delete 4.E.3.b.2 through 4.E.3.b.6 because they are already covered under D.2 and D.3.
Page 44, Part 4.E.6.a.2	"At a monthly average not less than 2 times per month in areas generating moderate volumes of trash on traffic collector streets and residential areas."	The Regional Board has not provided any data that supports a blanket requirement for bi-weekly street sweeping. Also, no analysis has been done at the state level on merging the efforts of the Permit and the proposed Trash TDML to ensure a comprehensive, cost-efficient approach that will result in real water quality benefits. Recommend modifying as follows: "At a monthly average not less than ~~2 times~~ **once** per month in areas generating low or moderate volumes of trash on traffic collector streets and residential areas."
Page 44, Part 6.b	"Permittee –owned parking lots shall be kept clear of debris and oil buildup and cleaned no less than 2 times per month and /or inspected no less than 2 times per month to determine if cleaning is necessary."	Change Paragraph to read: " Permittee-owned parking lots shall be inspected no less than 2 times per month to determine if cleaning is necessary. If cleaning is necessary, it shall be performed within one business day of inspection."
Page 73, Monitoring and Reporting Program, IIC3	"Permittees shall participate in tributary monitoring when the majority of a monitoring station sub-watershed is located in their jurisdiction."	Level of participation, financial or otherwise, is not defined. This scheme creates a negative incentive for Permittees who have the majority area of a monitoring station sub-watershed.
Page 76, Monitoring and Reporting Program, IIF	"The Principal Permittee and the City of Los Angeles shall participate in the SCCWRP's development and calibration of water quality models . . ."	The City has voluntarily participated in the development of the coliform bacteria TMDL by providing over $500,000 in monies and in-kind testing services. No mention is made of other cities that have runoff entering the Los Angeles River and Santa Monica Bay. Also, no limits are put on the extent of participation. According to the language as written, the City could be required to participate for the entire 5-year span of the Permit, if SCCWRP is unsuccessful at calibrating the model.

COMMUNICATION

TO: LOS ANGELES CITY COUNCIL File No. 01-1020

FROM: COUNCIL MEMBER MARK RIDLEY-THOMAS, CHAIR
ENVIRONMENTAL QUALITY AND WASTE MANAGEMENT COMMITTEE

	Yes	No
Public Comments	___	XX

COMMUNICATION FROM CHAIR, ENVIRONMENTAL QUALITY AND WASTE MANAGEMENT COMMITTEE relative to the draft 2001 National Pollution Discharge Elimination System (NPDES) Municipal Stormwater Permit.

Recommendation for Council action, as initiated by Motion (Ridley-Thomas - Galanter), SUBJECT TO THE APPROVAL OF THE MAYOR:

DIRECT the Chief Legislative Analyst (CLA) to forward the policy comment matrix (attached on the Council file in the joint CLA and Office of Administrative and Research Services (OARS) report dated June 18, 2001) to the Los Angeles Regional Water Quality Control Board (Regional Board), which details the City's recommended changes for the draft 2001 NPDES Municipal Stormwater Permit, specifically, the Council's position to:

a. Request deletion of the requirement for bi-weekly street sweeping.

b. Support the Los Angeles Regional Water Quality Control Board's (Regional Board) responsibility for inspections of industrial/commercial sites that are under the General Industrial Activities Stormwater Permit.

c. Support the requirements for Standard Urban Storm Water Mitigation Plans (SUSMP) for discretionary and ministerial projects.

d. Request a clarification of new Peak Flow Control requirements for all development that drains to soft-bottom channels.

e. Request deletion of the additional requirements on the City to require structural and non-structural Best Management Practices (BMP) and inspection of construction sites that are less than one acre.

f. Request that until March 2003, maintain current permit requirements, whereby the City is responsible only for Storm Water Pollution Prevention Plans (SWPPP) for sites 2-5 acres and after March 2003, require that the Regional Board take responsibility for inspections of construction sites greater than one acre.

g. Add the City of Los Angeles to the Principal Permittee and the Executive Advisory Committee (EAC) as the agencies to conduct formal discussions with the Regional Board on behalf of the permitees.

h. Request an exemption to the storm drain discharge prohibition requirements to allow the washing down of residual blood from trauma scenes.

Fiscal Impact Statement: The Chief Legislative Analyst (CLA) and the Office of Administrative and Research Services (OARS) reports that the total cost of the proposed permit, as written, would cost the City over $13.4 million (Table 3 of the joint CLA and OARS report dated June 18, 2001, contained on the Council file). The staff recommendations for the proposed 2001 NPDES Municipal Stormwater Permit will cost a total of $607,860 (see Table 2). This total cost includes additional staff costs of $432,779 for the expanded SUSMP implementation requirements and $175,081 for the addition of two inspectors to conduct expanded industrial/commercial site inspections. Any increase in attorney costs have not been calculated at this time, however, it is not expected to be significant the first year of the permit and may be revisited in future years if costs escalate substantially.

The 2001-02 Stormwater Pollution Abatement Fund (SPAF) included $530,000 for expected new NPDES permit requirements. The estimated staff costs of $607,000 will leave a shortfall of approximately $70,000 in the SPAF for these activities. All of the staff will not be necessary the first year of the NPDES permit implementation. In future years, however, the SPAF was budgeted to absorb an increase of $200,000, which will leave the SPAF short by $400,000 annually for permit implementation activities.

SUMMARY

On May 15, 2001, Council referred Motion (Ridley-Thomas - Galanter), relative to the draft 2001 NPDES Municipal Stormwater Permit, to the Environmental Quality and Waste Management Committee for consideration. Said Motion directed the CLA and OARS to prepare a report for the Environmental Quality and Waste Management Committee on various policy implications of the draft 2001 NPDES permit.

The Los Angeles Regional Water Quality Control Board (Regional Board) recently issued a draft 2001 NPDES Municipal Stormwater Permit for review and comment. The NPDES permit is reissued every five years and the existing permit expires on July 31, 2001. This permit identifies the waste discharge requirements for municipal storm water and urban runoff discharges within the County of Los Angeles and the incorporated cities (except Long Beach and Santa Clarita). The County of Los Angeles is the principal permittee and the City of Los Angeles and 82 other jurisdictions are co-permittees.

The proposed permit contains the following major new requirements for cities: Public Agency Activities, Programs for industrial/commercial inspections; Standard Urban Storm Water Mitigation Plans (SUSMPs), Implement Requirements for Peak Flow Control, Small Construction Site Requirements, Larger Construction Site Requirements, and Responsibilities of the Principal Permittee.

In their joint transmittal dated June, 18, 2001, the CLA and OARS reports that of the seven new requirements, the City will be most impacted by the Public Agency Activities requirement which contains language that would require all jurisdictions to conduct bi-weekly street sweeping. The existing permit requires a municipality to implement a street sweeping program that sweeps the streets at least monthly, and where feasible, more frequently in areas generating significant refuse. The Bureau of Street Services sweeps approximately 40% of the City's 13,100 curb miles of paved dedicated streets weekly and the remainder once a month. In commercial areas where persistent litter is a problem, the streets are swept weekly or daily. The annual current cost for the street sweeping activities is approximately $7.5 million of which $4.9 million is paid from the Stormwater Pollution Abatement Fund (SPAF). The current discretion given to municipalities allows the City of Los Angeles to provide street sweeping services more frequently in areas that generate more debris and less sweeping in areas that are less populated.

The CLA and OARS further report that bi-weekly street sweeping will increase the City's cost by an additional $4.6 million annually, $3.6 million in staff costs and $985,334 in expense costs. Additionally, a one-time capital cost for the purchase of additional street sweeping equipment is estimated at around $7 million. The cost to the ratepayer would be an additional charge of $4 a year for the annual costs alone, and the average residential Stormwater Pollution Abatement Charge would need to increase from $23 to $27 a year. This would increase another $7 or more if the equipment was purchased with SPAF funds. Moreover, the South Coast Air Quality Management District's fleet rules require the City to replace its street sweepers with ones that use alternative fuels when new equipment is purchased. The cost of new and upgraded facilities for natural gas sweepers has not been estimated at this time, however, it is expected to be substantial.

The proposed permit states that the increased street sweeping requirement apply until the implementation of a trash total maximum daily load (TMDL) program, which is currently under development for the Los Angeles River and Ballona Creek. Compliance with the trash TMDL will require the City to develop and implement a plan to reduce trash in the waterways. Although difficult to estimate, capital and operation/maintenance cost estimates are in the neighborhood of $900 million for full capture devices. The proposed new permit would require the City to spend millions of dollars to implement bi-weekly street sweeping, which will be necessary only until the trash TMDL is finalized.

The Regional Board has issued a schedule that states that there will be two more draft permits; a second draft of the permit will be issued on June 26, 2001 and a final draft will be issued on September 6, 2001. The proposed adoption date by the Regional Board is scheduled for October 25, 2001.

At its regular meeting held June 20, 2001, the Environmental Quality and Waste Management Committee Chair discussed this matter with City staff. The CLA reported that the Fire Department was seeking an exemption to the storm drain discharge prohibition requirements to allow the continued practice of washing down residual blood from trauma scenes. The CLA reports that data from the Los Angeles County Department of Health Services indicates that the small amounts of fluid from this practice will have no negative health effects. The Chair asked staff to explain why their recommendation was to delete the requirement regarding Peak Flow Control when their report indicates that they were uncertain about the intent. The Chair suggested that, procedurally, staff should first seek clarification regarding the requirement prior to taking a position on it.

The Environmental Quality and Waste Management Committee Chair concluded his consideration of this matter and recommended that Council approve the recommendations of the CLA and OARS as amended. The Chair recommended that Council request a clarification of the new Peak Flow Control requirements for all development that drains to soft-bottom channels, rather than approving staff's recommendation to delete them. The Chair further recommended that Council request an exemption to the Storm Drain Discharge Prohibition requirements to allow the washing down of residual blood from trauma scenes, as requested by the Fire Department. This matter is now submitted to Council for consideration.

Respectfully Submitted,

Council Member Mark Ridley-Thomas, Chair
Environmental Quality and Waste Management Committee

MOTION

Any official position of the City of Los Angeles with respect to legislation, rules, regulations or policies proposed to or pending before a local, state, or federal governmental body or agency must have first been adopted in the form of a Resolution by the City Council with the concurrence of the Mayor; and

The Los Angeles Regional Water Quality Control Board recently issued a draft National Pollution Discharge Elimination System (NPDES) Municipal Stormwater Permit for review and comment; and

The County of Los Angeles is the principal permitee and the City of Los Angeles and 83 other jurisdictions are co permitees of this permit; and

This permit identifies the waste discharge requirements for municipal storm water and urban runoff discharges within the County of Los Angeles and the incorporated cities (except Long Beach and Santa Clarita); and

It is critical that the City monitor the various regulatory actions and provide input to ensure that federal, state, and regional programs integrate with one another, are reasonable, include appropriate source control by state and federal agencies, and are consistent with the City's water quality improvement goals and policies; and

The City supports the implementation of programs that reduce water pollution and protect the beneficial uses of the region's water bodies; and

The City must ensure that water pollution control strategies and mandates can be realistically and cost efficiently implemented and funded, result in real water quality benefits, and successfully integrate with other environmental mandates and considerations.

NOW, THEREFORE, I MOVE that by adoption of this Resolution, the Office of Administrative and Research Services (OARS) and the Office of the Chief Legislative Analyst (CLA) are directed to prepare a report for the Environmental Quality and Waste Management Committee on the following issues regarding the draft 2001 NPDES Municipal Stormwater Permit:

1. The City of Los Angeles' role in formal discussions with the Regional Board, along with the Principal Permitee and the Watershed Management Committee representatives on the Executive Advisory Committee (EAC), regarding stormwater quality management plan implementation, monitoring and reporting;
2. The cost and appropriateness of an increased street sweeping program and its connection to the upcoming Trash Total Maximum Daily Load (TMDL) program;
3. New obligations assigned to the cities for additional inspection and enforcement activities on industrial/commercial and construction sites and appropriate permit fees funding;
4. A proposed new inspection program timeline and its consistency with the upcoming Los Angeles Standard Urban Stormwater Mitigation Plan (SUSMP) requirements; and
5. The accurate incorporation of federal and state rules.

Public Notice No. 01-041

NPDES No. CAS004001

NOTICE OF PUBLIC WORKSHOP

CONSIDERATION OF A STORM WATER MANAGEMENT/URBAN RUNOFF PERMIT

FOR

THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN,

EXCEPT THE CITY OF LONG BEACH

Los Angeles Regional Water Quality Control Board will conduct a workshop to consider public comment on a municipal storm water permit for Los Angeles County. Regional Board staff will provide background and a brief overview of the proposed draft permit. The public will have the opportunity to orally comment on the draft.

WORKSHOP DATE AND LOCATION:

DATE: Thursday, July 26, 2001
TIME: 9:00 a.m.
PLACE: Metropolitan Water District (MWD) Building
Board Meeting Room
700 North Alameda
Los Angeles

AVAILABILITY OF DOCUMENTS

You may contact Weindy Abarquez, at (213) 576-6802, to request a copy of the second draft permit and staff report. You may also download the draft permit and other related documents from the Regional Board Storm Water web page at www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html.

WORKSHOP PROCEDURE

The workshop will start at 9:00 am. It will be conducted before the Board. Interested persons are invited to attend. Oral statements will be heard; however, for the accuracy of the record, all comments should be in writing. Discussion will be limited to ensure that each component of the permit is addressed.

Date: July 11, 2001

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

JUL 12 2001

THE ADMINISTRATOR

The Honorable David Dreier
U.S. House of Representatives
Washington, DC 20515

Dear Congressman Dreier:

Thank you for your letter of April 24, 2001 concerning Clean Water Act permits for discharges from storm sewers owned by local governments. Your letter explains that several local governments are concerned that enforcement of pollution controls at individual industrial and commercial sites that discharge to the local storm sewer systems should be the responsibility of the State permit authority and that local governments should not be required to participate in this effort.

I understand that throughout the State, communities are facing a considerable challenge in the need to address storm water issues. While the State has already begun to substantially increase its staffing resources devoted to the storm water program, EPA recognizes that funding for the State storm water program needs to increase. We are continuing to discuss ways to further increase the State's investment, including discussions of EPA funding.

Urban runoff is the leading cause of water quality impairment throughout the country and in the Santa Monica Bay and the Los Angeles area. Effective programs for reducing pollution from municipal storm sewers are essential to protecting and restoring the Nation's water resources.

The Clean Water Act regulations concerning permits for discharges from municipal storm sewers provide that the State permit authority and the local government holding the permit share responsibility for inspections of facilities discharging to these storm sewers. The State is responsible for enforcing its general Clean Water Act storm water permits, while a local government permit holder needs to enforce local storm water ordinances (which may be similar, but not identical to, the State general permits). The specific responsibilities of the permit holder to monitor and control storm water pollutants from industrial and commercial facilities are normally determined through a cooperative process when a permit is prepared.

It is important to note that the storm water regulations require the local government permit holder to perform activities such as control, inspect, monitor, and require compliance of industrial and commercial facilities and that the permit holder must have the legal authority to ensure compliance. Such programs are already required in many storm water permits, such as the permits for Orange, Riverside and San Diego Counties, and they play a significant role in ensuring the overall effectiveness of the storm water program.

EPA has been intensively involved with all nine California Regional Boards and the State Water Resources Control Board to effectively implement the storm water program. From the initial issuance of the storm water permits to the current round of reissuing those permits, EPA has been working closely with the State to encourage stakeholder participation and cooperation in storm water programs. In addition, EPA and the State have worked together to respond to a petition filed by the Natural Resources Defense Council (NRDC) to withdraw the NPDES storm water program administered by the Los Angeles Regional Board. In response to the NRDC petition, Region 9 met with NRDC and the State to discuss steps to respond to the concerns in the petition.

If you have any additional questions or concerns please contact me, or your staff may call Shawna Roesch in the Office of Congressional and Intergovernmental Relations at (202) 564-3641.

Sincerely yours,

Christine Todd Whitman

City of MONROVIA

1887

Department of Public Works

VIA FACSIMILE

July 24, 2001

2001 JUL 27 P 3:31

Mr. Dennis A. Dickerson
Executive Officer
Los Angeles Regional Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Subject: Regional Board Workshop Concerning 2nd Draft of the NPDES Storm Water Permit

Dear Mr. Dickerson:

The City of Monrovia is pleased and appreciates that the Regional Board is holding another workshop on this very important issue. There have been several important improvements in this latest draft and we appreciate the amount of time your staff has spent reviewing and incorporating comments received to date. However, there are several fundamental issues that need to be addressed before the permit is issued.

We would first like to express our concern for the proposed format of the workshop. We have been informed that the Regional Board will be provided with suggested changes to the circulated 2nd draft without any written version of those changes. This will pose extreme difficulty for us to ascertain with any certainty exactly what it is the Board is proposing. As a result, our comments will not be as responsive as they would be had a comprehensive document, including possible future amendments, been provided to review. We hope that the Regional Board will not assume that the absence of comment equates to City's acceptance of the current draft.

Also, the absence of a redline-strikeout version of the first draft made the review of the second draft very cumbersome and problematic. In the spirit of continued collaboration, it is hoped that future revisions be made in the redline-strikeout format to help expedite future reviews.

The City of Monrovia feels that there are still some significant issues that need to be resolved before the permit is issued. Some of these issues include:

R0003175

- *Receiving Waters Limitation Language (Open Ended Permit)*
- *Redefinition the SUSMP & incorporation of previously removed elements*
- *Removal of the Meet and Confer Process from the permit*
- *Failure to recognize limited funding sources available to municipalities for many mandated permit programs*
- *Storm Water Inspection Programs (including State Permitted Facilities)*

Specific comments pertaining to this draft permit will be provided at a later date.

The development of appropriate permit language, which is acceptable to both the Regional Board and the permitted cities, is critical to insure the continued success of the NPDES program. In is our understanding that there have been several meetings between City, County and Board staffs that have not produce a fully acceptable permit, and a recent request for a facilitator to help assist in permit drafting was denied. The City of strongly encourages the Regional Board in the spirit of collaboration examine all avenues available and accept the cities' offers and develop a permit which is acceptable to all the interested parties.

Should you have any questions, please feel free to contact me at (626) 932-5544. Thank you for your attention.

Sincerely,

David F Fike

Notice of Public Meeting/Workshop

51 Years Serving Coastal Los Angeles & Ventura Counties

Thursday, July 26, 2001 ***444 th Regular Board Meeting***

9:00 a.m.

Meeting Location:

The Metropolitan Water District of Southern California
Board Room
700 North Alameda Street
Los Angeles, California

Agenda

Submittal of Written Material for Regional Board Consideration

To ensure that the Regional Board Members are given the opportunity to fully study and consider written material, it is necessary that 12 copies of any such material be provided to the Executive Officer not later than five (5) days before the meeting. This will allow distribution of the material to the Board Members and appropriate staff in advance of the meeting.

If you are reading a statement at the meeting, please provide the Executive Assistant with a copy at the meeting. The Board will endeavor to consider all matters listed on this agenda. However, time may not allow the Board to hear all matters listed. Matters not heard at this meeting may be carried over to the next Board meeting or to a future Board meeting. Parties will be notified in writing of the rescheduling of their item. Please contact the Regional Board staff to find out about rescheduled items.

The Board will recess for a 15-minute break at approximately 10:45 a.m., and recess for lunch at approximately 12:30 p.m. The meeting will reconvene at approximately 1:30 p.m.

Pledge of Allegiance. **R0003178**

1. Roll Call.
   [Ronji Harris, 213/576-6612].....Board Members Present

2. Order of Agenda.....Board Direction
   (The agenda items are numbered for identification purposes only and will not necessarily be considered in this order).

3. Board Member Ex Parte Communication Disclosure.
[Robert Sams 213/576-6797].....Information/Discussion
(Board Members will identify any discussions they may have had requiring disclosure pursuant to Government Code Section 11430.40)

4. Public Forum. *(Any person may address the Board regarding any matter within the Board's Jurisdiction. This need not be related to any item on the agenda. Remarks will be limited to three (3) minutes.)*

5. **WORKSHOP** to discuss the proposed renewal of the Municipal Storm Water Permit for the County of Los Angeles *(The existing municipal permit for the County of Los Angeles and 83 cities within the County expires in July 2001. Staff will brief the Board on efforts to renew the permit, as well as key issues that have arisen to date from pubic review of a tentative permit. Following the staff presentation, the Board will hear comments from permittees and interested parties. There will be no voting or formal action taken by the Board on this item.)*
[Xavier Swamikannu, 576-6654].....Information/Discussion

6. Executive Officer's Report.....Information/Discussion

7. Closed Session.....By Board
The Board will conduct a closed session to consider the following litigation matters. (Authority: Government Code Section 11126(e))

   (a) City of Los Angeles, City of Burbank v. Los Angeles Regional Water Quality Control Board, Los Angeles County Superior Court, Case Nos. BS 060957 and BS 060960;

   (b) USEPA and Los Angeles Regional Water Quality Control Board v. City of Los Angeles, U.S. District Court for the Central District of California, Case No. 01-00191 FMC (Mcx);

   (c) City of Thousand Oaks v. Los Angeles Regional Water Quality Control Board, Los Angeles County Superior Court, Case No. BS 067393.

   (d) Petitions to SWRCB No. A-1357 and A-1357(a) Municipal Storm Water Permits for Ventura County, Order No. 00-108, NPDES Permit No. CAS004002.

   (e) United States of America and State of California v. Montrose Chemical Corporation, et al, United States District Court, Central District of California, Case No CV 90-3122-R.

8. Adjournment of Current Meeting. There will be a Special Meeting on August 8, 2001, 9:00 a.m. at the Metropolitan Water District of Southern California, 700 North Alameda Street, Board Room, Los Angeles, and the next Regular Meeting is scheduled for August 23, 2001, 9:00 a.m. at the Richard H. Chambers, U.S. Court of Appeals, 125 South Grand Avenue, Pasadena.

**

A copy of the complete agenda package is available for examination at the Regional Board Office during regular working hours. Questions about specific items on the agenda should be directed to the staff person whose name is listed with the item.

***

Material presented to the Board as part of testimony that is to be made part of the record must be left with the Board. This includes photographs, slides, charts, diagrams, etc. All Board files pertaining to the items on this Agenda are hereby made a part of the record submitted to the Regional Board by staff for its consideration prior to action on the related items.

***

Pursuant to Water Code Section 13320, any aggrieved person may file a petition to seek review by the State Water Resources Control Board (SWRCB) of any action taken by the Regional Board. Such petition must be filed within 30 days of the action. Petitions must be sent to SWRCB, P.O. Box 100, 1001 I St., Sacramento CA 95812.

444th Regular Meeting/Workshop

ITEM: 4

SUBJECT: Public Forum

DISCUSSION: Any member of the public may address the Board relating to any matter within the Board's jurisdiction. This need not be related to any item on the agenda.

California Regional Water Quality Control Board, Los Angeles Region
444th Regularly-scheduled Meeting of July 26, 2001 (Los Angeles)

Item 5

Subject Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges, within the County of Los Angeles and the incorporated cities therein except for the City of Long Beach (hereafter referred to as the municipal storm water permit, or permit).

Purpose To conduct a workshop to discuss critical issues arising from a proposed renewal of the permit. The Board directed staff to prepare for this workshop in response to a request, made by an Executive Advisory Committee (EAC) for the Permittees, for adequate time for public comment before the Board.

As this item is being presented for informational purposes, no regulatory action is requested from the Board at this workshop. However, as the existing permit expires on July 30, 2001, the Board may wish to provide direction as staff prepares the proposed permit for adoption later this year.

Background The storm drain system regulated by the Board is prinicipally owned and operated by the Los Angeles County Flood Control District (Principal Permittee). This system drains the coastal slopes of the Transverse Ranges, moving storm flows as well as a significant amount of dry weather runoff into the Santa Monica Bay and the Los Angeles/Long Beach Harbor.[1] It is one of the largest storm drain systems in the nation, when measured in terms of both areal extent as well as differences in vertical elevations.

The storm drain system is also one of the most complex to operate, when considering that it encompasses 84 municipalities. Although principally owned and operated by the Principal Permittee, this system collects runoff from 84 municipalities which, except for the City of Long Beach, are all Co-Permittees; these Co-Permittees have varying degrees of responsibility for development and maintenance of their portions of the oeverall system. The Permittees' physical assets that comprise the infrastructure of the system include over 100,000 catch basins, about 4,300 miles of underground storm drains, and about 500 miles of open channels. A precise summary of these physical assets is not possible, as the

[1] The Los Angeles County Flood Control District also operates a storm drain system on the inland side of the Transverse Ranges; this system falls under the jurisdiction of the Lahontan Regional Board.

Permittees do not have a comprehensive map or database that can accurately show the location, extent, and ownership of all underground drains and catch basins – which is an illustration of difficulties arising from the complex ownership structure of the storm drain assets.

Regulatory History

1990: The Regional Board adopted the first municipal storm water permit for the County, Order No. 90-079, which required Permittees to amend ordinances and implement best management practices (BMPs) – in particular, a minimum of 13 BMPs such as street sweeping and construction site controls.

1996: After 18 months of effort to renew the 1990 permit, the Board adopted Order No. 96-054 (i.e. the existing permit – see attachment 5.F). Key elements of this permit were requirements that Permittees develop and implement model programs for Public Information and Participation, Industrial/Commercial Activities, Development Construction, Illicit Connections and Illicit Discharges, Public Agency Activities, and Development Planning. The permit does not include a requirement for inspections as part of an industrial/commercial control program; rather, after significant debate, the Board included a requirement that Permittees conduct site visits of industrial facilities in their jurisdications. This was intended as an interim step, to give Permittees a 5-year period before requiring a stronger industrial/commercial control program.

1999: Following adoption of Order 96-054 and litigation by the City of Long Beach, the Board adopted Order No. 99-060, with separate requirements for the City of Long Beach.

2000: The Permittees' proposed model program for Development Planning was vigorously debated in a public workshops in 1999 and 2000, culminating in the Board's adoption of Order 00-02, specifying design criteria for a Standard Urban Storm Water Mitigation Plan (SUSMP). In response to a petition of the Board's action by 33 of the Permittees and other interested parties, the State Board affirmed in large part the Regional Board action (see State Board Order WQ 2000-11, attachment 5.C-2).

2001: On January 31, 2001, the Permittees submitted a renewal application for the permit, which expires on July 30, 2001.[2] Since then, staff, the Permittees, and Heal the Bay (on monitoring issues) have devoted significant time to exchanging information and

[2] Per federal regulations, Order No. 96-054 will remain in effect until the Board acts to renew the permit.

reviewing drafts of the proposed permit, which will enter a third term since the initial permit was adopted in 1990.

Compliance Status Staff took only a few actions to enforce the permit between 1996 and 2000, as lack of staff resources prevented rigorous oversight of Permittees' compliance status. Had staff resources been adequate for systematic compliance checks of all Permittees, many more enforcement actions most likely would have needed to be taken. The few enforcement actions that were taken were generally in response to complaints, and included 5 Notices of Violation (NOVs) issued to the:

- City of Culver City (February 1998), for failure to maintain erosion and sediment controls at one of its construction sites, which resulted in a discharge of mud into Ballona Creek. The City ultimately implemented sediment controls, but only after repeated discussions with Regional Board staff and the City's consultant.

- Cities of Pomona and Lynwood, for failure to submit Annual Reports for 1996/97 by the due date of October 15, 1997. The City of Lynwood submitted its delinquent Annual Report after receiving the NOV. The City of Pomona did not submit its Annual Program Report until the Executive Officer issued an Administrative Civil Liability (ACL) in the amount of $6,700, which the City promptly paid.

- City of Alhambra, for a discharge of muddy water to the storm drain from a pipeline repair (1998). The City complied after receiving this NOV.

- City of Monterey Park, for failure to protect slopes from erosion at a city construction site on Ramona Boulevard (1999). The City of Monterey Park ultimately complied but only after repeated discussions with City staff.

In 2001, staff completed a review of the 1999/00 Annual Program Report, and issued 11 NOVs for failure to implement various programs, including, among others, requirements to: modify planning procedures (such as a CEQA checklist) to integrate storm water considerations; and require pollution prevention plans at construction sites between 2 and 5 acres. The 11 NOVs were issued to each of the Cities of: Azusa, Cerritos, Huntington Park, Inglewood, Malibu, Maywood, Monrovia, Rolling Hills Estates, San Gabriel, South Pasadena, and Vernon. Many of these Permittees have vehemently objected to these NOVs, have

submitted documentation of their objections, and are demanding that the Executive Officer invoke a "Notice to Meet and Confer" provision, as set forth in the existing permit (see also a discussion on this provision on page 8 of this Item). This issue has not been resolved, and staff still needs to complete a review of the documentation submitted to date.

Most recently, in March 2001, staff issued NOVs to each of the Cities of Los Angeles and Covina for discharges of sediment to the storm drain.

Permit Objectives

Staffs' goal is to propose renewal of a permit that will implement regulations and guidance from US EPA, State Board, and Regional Board. Specific objectives for the third-term renewal are to:

- more effectively prohibit non-storm water (dry weather) discharges to the storm drain system, through elimination of illicit connections and unauthorized discharges;
- more effectively reduce pollutants in storm water; and
- require that Permittees implement additional control measures that the Board may determine are necessary for TMDLs[3] that staff anticipates over the next five years.

Permit Approach

To meet these objectives, staff has structured the draft permit with several improvements over the existing permit, as outlined below:

Receiving Water Limitations (Part 2, page 16): Clarifies that discharges must meet narrative water quality objectives, including that they must not cause nuisance (in addition to the existing requirement to reduce pollutants to the maximum extent practicable). Additionally, Part 3, Section C (page 18) adds a requirement to implement load allocations approved by the Board in a TMDL, without reopening the permit.

Public Information and Participation (Part 4, Section B, pages 23 to 26): No significant changes.

Development Planning (Part 4, Section D, pages 29 to 35): Lowers the threshold of industrial/commercial development that is subject to Standard Urban Storm Water Mitigation Plan (SUSMP) requirements from 100,000 square feet to one acre (consistent with USEPA Phase II), beginning in 2003; and expands SUSMPs to:

- environmentally sensitive areas

[3] Total Maximum Daily Loads (TMDLs).

- retail gasoline outlets (RGOs)
- ministerial as well as discretionary projects.

Development Construction (Part 4, Section E, pages 35 to 38): Lowers the threshold for a pollution prevention plan and wet weather inspection program to construction sites one acre and greater in size (currently two acres and greater in the existing permit).

Industrial/Commercial Inspections (Part 4, Section C, pages 26 to 29): Upgrades the existing site visit program to an inspection program of select industrial/commercial sectors.

Public Agency Activities (Part 4, Section F, pages 38 to 45): Includes explicit requirements to control trash.

Illicit Connections and Discharges (Part 4, Section G, pages 45 to 46): Requires the Principal Permittee to take more responsibility for tracking illicit discharges and connections, and upgrades passive field screening activities (during regularly scheduled maintenance) to a proactive field screening program.

Monitoring (Attachment T): Adds mass emissions monitoring on the Santa Clara River and Dominguez Channel, and a requirement to conduct a biomonitoring assessment with a minimum of 20 stations.

Enforcement: Deletes the Notice to Meet and Confer provision in the existing permit, and instead relies upon the State's policy of progressive enforcement.

Permittees have not provided specific estimates of additional costs that might be incurred by the requirements highlighted above. Permittees have, however, provided estimates of their 2000/01 budget allocated for storm water program. This amount aggregates $142 million, as reproduced in the table[4] on pages 6 to 7.

Critical Issues

Since receiving the application for renewal, on January 31, 2001, staff have dedicated significant time and effort to involving the public in the renewal process, and have been responsive to public comment. However, many critical issues are before the Board, as summarized below.

[4] The amounts in the table (pages 6 to 7) are self-reported. As permittees may not have been consistently compiled their expenditures in a consistent manner, the amounts should be regarded as rough estimates.

Table 5
SUMMARY OF FISCAL RESOURCES 2000/01

Permittee	Program Management	IC / ID	Development Planning and Construction	Public Agency Activities	Public Information and Participation	Monitoring Program	Other	Total
Agoura Hills	$30,000	$0	$15,000	$100,000	$10,000	$0	$15,000	$170,000

Enforcement: ***Should the new permit contain a safe harbor clause (i.e. a "Notice to Meet and Confer")?***

During the 18-month renewal effort in 1995 to 1996, the Board approved a "Notice to Meet and Confer" (NTMC) provision (existing permit, Part 2, section G). Many of the Permittees strongly advocated for this provision, which they envisioned as an important administrative review process for resolving permit disputes before the Board could take formal enforcement action. It was actually used only once, in 2000, when the Regional Board issued NTMC letters in order to obtain information on permittees' efforts to abate trash in the Los Angeles River and Ballona Creek watersheds. As mentioned above, several Permittees want to invoke the NTMC as an interim step to any penalties the Board might issue for the 1999/00 Annual Program Report violations.

Subsequent to renewal of the existing permit, the State developed an enforcement policy (State Board Resolution 96-030) and guidance, which sets forth a progressive strategy that has the goal of ensuring consistent, predicable, and fair enforcement of regulations. This is now a well-established and widely implemented policy throughout the State, and has been successfully implemented in Los Angeles Region. Therefore, staff submits that the NTMC provision should not be included in the renewed permit.

Receiving Water Limitation: ***In structuring a receiving water limitation, has staff correctly complied with State Board direction?***

Some environmentalists believe that the draft permit should contain numerical limitations. Permittees, for the most part, believe that they should not be subject to either numerical or narrative receiving water limits, as their SQMP (Storm Water Quality Management Plan) is designed to reduce pollutants only to the maximum extent practicable.[5]

In Part 2 (page 16) of the draft permit, staff incorporated narrative receiving water language as directed by the State Board in Order No. 99-05 (Attachment 5A-2). Subsections 2.1 and 2.2 slightly modify the State Board language in that: 2.1 separately states that discharges that cause or contribute to the exceedences of water quality standards are prohibited, and 2.2 separately states the

[5] Regulations do not define what exactly constitutes the Maximum Extent Practicable (MEP). In general, MEP relies on best management practices that emphasize pollution prevention and source control (i.e. the first line of defense), with additional structural controls as needed (an additional line of defense). With some exceptions, criteria for these BMPs to meet MEP tends to be developed on a case-by-case basis in the storm water programs overseen by the US EPA and delegated States.

discharges shall not cause a condition of nuisance [such as trash]. Some Permittees contend that these modifications exceed State Board Order No. 99-05. However, a review of language in other recent municipal storm water permits, issued by the State Board itself and by other Regional Boards, indicates that the subsection language is substantially similar (see attachments 5.A.3 to 5.A.7).

Some Permittees also contend that the draft language is inconsistent with the U.S. Court of Appeals decision in, *Defenders of Wildlife v. Browner* (9th Cir. 1999). This decision found that the Clean Water Act does not require MS4 dischargs to strictly comply with water quality standards. However, the decision did uphold US EPA's discretion to establish narrative requirements, as it deemed necessary. As discussed in State Board's Office of Chief Counsel memorandum (Attachment 5.A-1), the Clean Water Act allows States to include such provisions, and concluded that the 9th Circuit decision did not contradict State Board Order No. 99-05.

Inspections: ***Should the Regional Board require Permittees to inspect industrial/commercial facilities?***

As required by the previous permit, the Principal Permittee conducted a critical source identification study[6] and identified five of the highest risk activities that pollute storm water in the County. Four of these activities – scrap metals, trucking, chemical, metal fabricating – are regulated by the State's General Permit for Industrial Activities. The other activity – automotive services – is not subject to the States General Permit) or Phase 1 regulations. Also, through the same source identification process, the Principal Permittee identified two additional activities – retail gas outlets (RGOs) and restaurants – at high risk of storm water pollution.

In the first draft (April 13, 2001), staff took a "top – down" approach to inspections, proposing that Permittees screen databases of tens of thousands of industrial and commercial facilities to identify facilities that should be targeted for an inspection program. In response to comments, staff focussed the inspection requirement in the second draft (June 29, 2001) to better structure a partnership among the Regional Board and Permittees, whereby the Regional Board would take the lead on the "Phase 1" industrial facilities subject to the State's General Permit, and the Permittees would take the lead to regulate other problem activities, such as automotive service facilities, restaurants, and RGOs.

[6] Critical Source Selection and Monitoring Report, prepared for the Los Angeles County Department of Public Works by Woodward-Clyde, September 3, 1996.

Accordingly, the current draft language (Part 4, Section C, pages 26 to 29), upgrades the Permittees' existing site visitation program to a site inspection program with the following elements:

- **Automotive service facilities:** Permittees must inspect all facilities once every two years, for compliance with their model programs and local storm water ordinances. There are about 6,000 such facilities in Region 4.
- **Phase 1 Industrial facilities:** There are about 2,600 industrial ("Phase 1") facilities that are enrolled in the State's General Permit, and an unknown number of non-filers. To help identify non-filers, Permittees must visit (not inspect) facilities in their jurisdictions to determine that Phase 1 facilities are enrolled under the State's General Permit. Although Permittees are being required to help identify non-filers, they are not being asked to assume the State's compliance and enforcement responsibility under the General Permit. Of course, this requirement does not preclude Permittees from compliance oversight vis a vis their own local ordinances and model programs.
- **RGOs:** This remains an outreach program, and requires the Prinicipal Permittee to communicate appropriate BMPs to RGO operators. To optimize outreach efforts, such communications can be through corporate or franchise organizations, as opposed to visits to each retail outlet (there are 2,133 RGO in the County, most of which are associated with one of six large petroleum companies.
- **Restaurants:** Staff has upgraded this to an inspection program, by requiring County Health inspectors to include storm water criteria during their health inspections. These storm water criteria must be applied once every two years during the inspections (which, for health purposes, are much more frequent). There are about 20,000 restaurants in the County.

To ensure the productivity of the inspection partnership, the permit also contains language specifying interagency coordination.

Many Permittees have questioned the Board's authority to require an Industrial/Commercial Program that specifies inspections of facilities within their jurisdictions. In response, staff point out that the US EPA, in its regulations and guidance, clearly states that Permittees must have a program to control industrial sources of storm water pollution. In structuring the General Permit back in 1990, the State envisioned that this would be a joint effort among Regional Boards and municipalities. The US EPA recently

reiterated this understanding, in a letter dated December 19, 2000 (see attachment 5.B.5). Finally, in approving the site visit program in the existing permit, it was understood that this was an interim step, to give Permittees a 5-year outreach period before requiring a stronger industrial/commercial control program.

The attachments in Section 5.B contain selected references from regulations and guidance that pertain to this program. Federal regulations (Attachment 5.B.2) require that applicants for municipal storm water permits implement a program to monitor and control pollutants in storm water discharges from specific industrial activities, as well as additional industrial sources that the applicant determines are contributing pollutant to the MS4. Staff believe that automotive services activities fall into the additional category.

The federal regulations further state that the program shall include procedures for inspections, monitoring, establishing, and implementing pollutant controls. Furthermore, Chapter 3.0 of USEPA Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from MS4s (Attachment 5.B.3) specifies that municipal applicants must demonstrate that they possess adequate legal authority to:

- Control construction site and other industrial discharges to MS4s;
- Prohibit illicit discharges and control spills and dumping;
- Carry out inspection, surveillance, and monitoring procedures.

Staff believe that these regulations apply to BMPs that are critical to preventing pollution, or controlling pollution sources – indeed, a large degree of the program's effectiveness relies upon prevention BMPs. On the other hand, many Permittees don't believe that they have legal authority to inspect sites, and that they should not be required to take any enforcement action until an illicit discharge has actually left private property and entered a public street or storm drain. However, staff points out that US EPA clearly states, in Chapter 6.3.3 of the Guidance Manual (Attachment 5.B.3), that a municipality is ultimately responsible for discharges from their MS4. Consequently, the Permittees' proposed model program for Industrial/commercial Control needs to set forth how the municipality will help the USEPA and authorized States to:

- **Identify** priority industries discharging to their systems;

- **Review and evaluate** storm water pollution prevention plans (SWPPPs) and other procedures that industrial facilities must develop under general or individual permits;
- **Establish and implement** BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- **Inspect and monitor** industrial facilities discharging storm water to the municipal systems to ensure these facilities are in compliance with their NPDES storm water permit, if required.

Development Planning: ***Does the extension of SUSMP requirements to cover retail gasoline outlets, ministerial projects, and environmentally sensitive areas, comply with the State Board's SUSMP decision?***

Yes. The Development Planning subsection (Part 4, Section D, pages 26-53) incorporates SUSMP requirements as upheld by the State Board in State Board Order No. 2000-11 "SUSMP Order" (Attachment 5C.2) and corrects deficiencies that were identified.

The SUSMP Order set aside the applicability of the SUSMP requirements to development projects in environmentally sensitive areas and to ministerial projects, as defined in the California Environmental Quality Act (CEQA), until a full and fair consideration by the Regional Board during permit reissuance. The SUSMP Order also set aside the applicability of numerical mitigation criteria to retail gasoline outlets until the Regional Board provided proper justification and established thresholds. While some commenters have suggested that the proposed permit violates the SUSMP Order by the extension, a memorandum issued by the State Board Chief Counsel identifies these three areas as potential areas for extension of SUSMP requirements by Regional Boards in the future consistent with State Board guidance in its SUSMP Order (Attachment 5C.3).

It is proper to extend coverage of SUSMP requirements to developments within, adjacent to or discharging directly to environmentally sensitive areas. Development and urbanization especially threaten environmentally sensitive areas, because these areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. A development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. Staff has provided thresholds for developments in environmentally sensitive areas to exclude small developments (less than 2,500 square feet impervious surface) and insignificant land use conversions (less than

10% of the site as impervious surface compared to the existing natural condition). Findings B.6, B.7, and E.4.

It is appropriate to apply numerical design criteria for storm water mitigation to new retail gasoline outlet developments. Retail gasoline outlets are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from retail gasoline outlets have high concentrations of hydrocarbons and heavy metals. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks. Retail gasoline outlets in western States such as Oregon and Washington are already subject to storm water numerical mitigation criteria. As recommended by the State Board in its SUSMP Order, Board staff has established thresholds for the criteria to apply to retail gasoline outlets (5,000 square feet or more of impervious surface and projected Average Daily Traffic of 100 vehicles or more) with proper justification. Finding C.6., Attachment 5E.1.

It is proper to apply SUSMP requirements to all planning priority project SUSMP categories, including ministerial projects. The California Environmental Quality Act (CEQA) (Cal Pub Resources Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects, that is projects which involve the use of established standards or objective measurements. For purposes of water quality, CEQA distinctions are not germane because it is a procedural statute that provides a public forum for consideration of environmental impacts of governmental decision-making. CEQA is not a statute for water quality protection. Municipalities have multiple ways of ensuring that SUSMP requirements are applied in a consistent manner within SUSMP categories. A municipality may give itself discretionary authority by adopting local ordinance provisions that create decision-making discretion for SUSMP categories (Attachment 5.C.4). Alternatively, a municipality may establish standards and objective criteria for review of ministerial projects that are in SUSMP categories administratively (Attachment 5.C.6.).

Consistent with the Regional Board's action in the Ventura County municipal storm water permit, the proposed permit includes numerical design criteria for water quality flow in addition to water quality volume.

Development Construction: ***Are new requirements to inspect construction sites greater than 1 acre appropriate, and are they consistent with regulations and other permits?***

Small construction sites account for a significant amount of pollution from construction activities. In response to this concern, the Development Construction subsection (starting in Part 4, Section E, page 35 of the draft permit) requires that Permittees inspect construction projects one acre or greater to ensure compliance with local agency ordinances and model programs to prevent erosion, control sediment, and manage on-site construction wastes.

The existing permit has a similar requirement for construction sites two acres or greater. Staff proposes to lower the threshold is to 1 acre by 2003, when US EPA Phase II regulations to regulate smaller (1 acre and above) construction sites become effective. Also, the Board has already issued municipal permits with such a requirement, to the City of Long Beach in 1999 and the County of Ventura in 2000.

Total Maximum Daily Loads (TMDLs): ***Should the Board include a provision requiring implementation of TMDL load reductions, without reopening the permit?***

TMDLs are one of the Board's highest priorities. In view of the Region's highly urbanized environment, it is likely that pollutants in storm water will be allocated significant load reductions. While specific load reductions can't be forecast at this time, staff has structured the permit as a vehicle for achieving load reductions (Part 3, Section C).

Public review of TMDLs, which will typically be in the form of an amendment to the Basin Plan, will occur during the TMDL adoption process; and staff does not anticipate that there will be a need for an additional public process for TMDL implementation measures. Therefore, upon approval of a TMDL, implementation of municipal storm water requirements (specified in that TMDL) will become effective and enforceable under the permit. In other words, municipal storm water requirements will be automatically included in this proposed permit upon adoption of a TMDL by the Board, without reopening this permit. This TMDL requirement and structure is consistent with TMDL provisions in the City of Long Beach and County of Ventura permits.

Monitoring: ***In the event that monitoring indicates storm water from a particular municipality as a source of toxicity, should the Board require that Permittee to implement additional BMPs needed to reduce toxicity?***

Per the *Basin Plan*, there should be no toxicity in receiving waters. Per Parts 2 and 3 of the draft permit, Permittees must revise their Storm Water

Management Plan, as necessary, to meet receiving water limitations, including water quality objectives. Attachment T to the Monitoring and Reporting Program requires the Principal Permittee to monitor for toxicity and, upon finding toxicity, to conduct a "Toxicity Identification Evaluation" (TIE) and submit a "Toxicity Reduction Evaluation" (TRE) to the Regional Board. As a result of the TRE, the affected Permittee would then be responsible for modifying its SQMP to implement BMPs to eliminate toxicity based on the sources of toxicity within its jurisdiction.

Illicit Connections and Discharges: ***To better identify and eliminate IC/ID (illicit connection/illicit discharge) problems, should the Board require the Principal Permittee to better track IC/ID problems, and should the Board upgrade the Permittees' passive field screening program?*** During dry weather, much of the flow to the storm drain system consists of illicit discharges.[7] Reporting of these problems, as summarized in the Fact Sheet/Staff Report (pages 23 to 31), shows erratic IC/ID occurrences that bear no relationship to land uses or to estimated expenditures by Permittees. Under current operating practices, the Prinicipal Permittee is unable to track reports of illicit connections and discharges in order to identify problem areas and prioritize corrective action. Many of the Permittees cannot estimate the length of their portion of the storm drain system. Many more of these Permittees are unable to estimate how much of their portion of the storm drain system has been field screened for IC/ID problems over the past 5 years, partly because the Permittees' existing Storm Water Quality Management Plan requires field screening only "during regularly scheduled maintenance."

In the first draft, staff proposed that the Permittees develop a GIS (Geographical Information System) to better track IC/ID problems and, based upon annual evaluations of IC/ID problems, to implement an active screening program in problem areas. Several Permittees objected to this, stating that a GIS was too expensive to develop, and that simpler systems (e.g. pin maps) could suffice. In the second draft, staff is proposing that the Principal Permittee – with the cooperation of Permittees – develop a system (type of system unspecified) to track and prioritize IC/ID problems. The Principal Permittee objects to this requirement out of concern over: (a) anticipated difficulties in coordinating with other Permittees, and (b) the cost of a GIS, which cost could be well in excess of $15 million (the Principal Permittee feels that GIS is the only system that is sophisticated enough to comprehensively locate all permitted storm drain connections, and to track IC/ID occurrences in the storm drain system, as Board staff have suggested).

[7] Federal regulations define an illicit discharge as "...any discharge to an MS4 that is not composed entirely of storm water..." with some exceptions (such as NPDES-permitted discharges and emergency fire fighting flows).

Staff strongly believe that a comprehensive map[8] or system is needed to track and evaluate IC/ID occurrances, that the Principal Permittee is the appropriate entity with adequate control to take on this responsibly, and that other Permittees should be required to undertake active field screening as such needs are indicated by a better tracking tracking system. Discussions on this issue are ongoing with the Principal Permittee.

Conclusion Pollutants in dry weather runoff and storm water are the most significant source of impairment to water quality in the Los Angeles Region. For the third 5-year term of the County's permit, staff has tried to carefully and reasonably structure requirements – including specific performance objectives – that are needed to better focus Permittees' storm water management programs in order to more effectively control pollutants.

Recommendation The workshop is being conducted for informational purposes, and the Board is not being asked to take regulatory action at this time. However, the Board may consider staffs' position on the critical issues summarized above in light of comments that will be received from Permittees and interested parties, and provide direction to staff.

Next Steps The deadline for submittal of written comments on the second draft (dated June 29, 2001) is August 6th. After consideration of oral comments at the workshop on July 26th, the Board may wish to extend this deadline.

Following the workshop, staff intend to issue a third draft of the permit, which will incorporate direction that the Board may wish to provide, and consideration of additional written comments that are anticipated on the second draft. Adoption of the permit is tentatively scheduled for the October or November Board meeting.

SUBJECT: RECEIVING WATER LIMITATIONS IN MUNICIPAL STORM WATER PERMITS

The purpose of this memorandum is to discuss a recent federal appellate decision on this issue, and to provide advice on how to proceed in the future.

BACKGROUND

The State Water Resources Control Board (State Water Board) first addressed the issue of whether permits for municipal separate storm sewer systems (MS4) must include effluent limitations that will achieve compliance with water quality objectives in Order WQ 91-03. There, the State Water Board concluded that permits for MS4s must contain effluent limitations based on water quality standards. The Board further concluded that it was appropriate for Regional Water Quality Control Boards (Regional Water Boards) to achieve this result by requiring best management practices, rather than by inserting numeric effluent limitations. The State Water Board addressed this issue again in Order WQ 98-01, wherein it prescribed specific language that should be in receiving water limitations in order to protect water quality objectives. Finally, in Order WQ 99-05, the State Water Board modified that language in order to meet specific objections by the U.S. Environmental Protection Agency (EPA).

In its opinions discussing the need for receiving water limitations to protect water quality objectives, the State Water Board provided several rationales. First, U.S. EPA issued a legal opinion concluding that MS4s must meet both the technology-based requirements of the Clean Water Act and any more stringent requirements necessary to protect water quality. The State Water Board also noted that the Clean Water Act contains explicit authority for states to require provisions in addition to the technology-based controls. Finally, the State Water Board relied on provisions of the California Water Code that all waste discharge requirements must take into consideration the appropriate water quality objectives.

DEFENDERS OF WILDLIFE V. *BROWNER*

In a case arising out of MS4 permits issued by U.S. EPA to several Arizona cities, the Ninth Circuit Court of Appeals held that the Clean Water Act does not require MS4 discharges to comply strictly with state water quality standards. (*Defenders of Wildlife* v *Browner* (9th Cir. 1999) ____ F.3d ____.)[1] In other words, the Court disagreed with U.S. EPA's legal opinion that all MS4 permits must include more stringent requirements to achieve water quality standards. While holding that that the Clean Water Act does not require all MS4 discharges to comply strictly with state water quality standards, the Court also held that U.S. EPA has the authority to determine that ensuring strict compliance with state water quality standards is necessary to control pollutants. Thus, the Court did uphold the permits that included narrative requirements to achieve compliance with state water quality standards, based on U.S. EPA's discretion to establish those requirements.[2]

DISCUSSION

The Ninth Circuit case, which is controlling in California, grants U.S. EPA discretion to decide whether or not to require MS4s to comply with state water quality standards. It specifically authorized an approach similar to that approved by the State Water Board in its various orders, of requiring compliance through an iterative process of stronger BMPs. While one of the bases for the State Water Board's opinions—the U.S. EPA legal opinion requiring compliance with state water quality standards in all MS4 permits—has been weakened, the Court clearly upheld U.S. EPA's discretion to adopt similar permit provisions. Moreover, the Clean Water Act does clearly allow states (as well as U.S. EPA) to include such provisions. Finally, the California Water Code also requires that waste discharge requirements ensure compliance with water quality objectives.

As discussed above, the State Water Board clearly has the authority to retain the receiving water limitations language it has developed in its various orders consistent with *Defenders of Wildlife*. Moreover, because most MS4 discharges enter impaired water bodies, there is a real need for permits to include stringent requirements to protect those water bodies. As total maximum daily loads are developed, it is likely that MS4s will have to participate in load reductions, and the MS4 permits are the most effective vehicles for those reductions. The existing receiving water limitations language has been developed by the State Water Board to achieve compliance with water quality objectives, and should therefore be retained.

---

[1] The Court did unequivocally state that industrial storm water dischargers do have to comply with both technology-based and water quality-based requirements.

[2] It is interesting to note that the challenge to the permits came from environmental groups who claimed that the water quality standards requirement was not adequate because it did not include numeric effluent limitations. This is similar to challenges made to Regional Water Boards who have used the narrative language adopted by the State Water Board, which in turn is similar to U.S. EPA's language in the Arizona permits.

CONCLUSION

The recent Ninth Circuit opinion upholds the discretion of the state to issue permits to MS4s that require compliance with water quality objectives through iterative BMPs. The State Water Board has issued orders requiring such compliance. The fact that many MS4s discharge pollutants of concern into impaired water bodies makes the requirements useful tools in protecting water quality. The Regional Water Boards should continue to use the language developed by the State Water Board.

Subject: MUNICIPAL STORM WATER PERMITS: COMPLIANCE WITH WATER QUALITY OBJECTIVES

ISSUE

Must storm water permits for municipal separate storm sewer systems (MS4s) include requirements necessary to achieve water quality objectives?

CONCLUSION

Storm water permits issued to MS4s must include requirements necessary to achieve water quality objectives.

DISCUSSION

Section 301 of the Clean Water Act prohibits the discharge of any pollutant unless pursuant to a National Pollutant Discharge Elimination System (NPDES) permit. Section 301 also requires compliance with effluent limitations necessary to achieve compliance with technology-based standards (e.g., best practicable control technology currently available or secondary treatment). Finally, Section 301 requires compliance with any more stringent effluent limitation which are necessary to protect water quality standards.

Section 402(p) of the Clean Water Act includes a technology-based standard for storm water permits issued to MS4s. Such permits must require:

> "controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods ...."

Section 402(p) does not discuss water quality-based standards. A question is therefore raised whether permits issued to MS4s

must include only effluent limitations to meet the technology-based standard of "maximum extent practicable" (MEP), or whether they must also include water quality-based effluent limitations.

This question has already been answered by the SWRCB in Order No.WQ 91-03. The answer is that permits issued to MS4s must include effluent limitations which will achieve the MEP standard, and will also achieve compliance with water quality objectives. The SWRCB stated:

> We therefore conclude that permits for municipal separate storm sewer systems issued pursuant to Clean Water Act Section 402(p) must contain effluent limitations based on water quality standards. Order No. WQ 91-03, at slip op. 36.

The specific language in effluent limitations or other permit conditions is left to the discretion of the agency issuing the permit. Thus, for storm water permits for MS4s, it is appropriate to include "best management practices" (BMPs) instead of numeric effluent limitations. See, Order No. WQ 91-03, at slip op. 37-38. These BMPs may be adequate as both technology-based limitations and water quality-based limitations. *Id.* Section 301(b)(1)(C) of the Clean Water Act broadly requires compliance with "any more stringent limitation, including those necessary to meet water quality standards". The legal requirements for determining effluent limitations in permits are listed in 40 Code of Federal Regulations (CFR) Section 122.44. The SWRCB interpreted these provisions in Order No. WQ 91-03, and concluded permits for MS4s may include BMPs as effluent limitations.

In Order No. WQ 91-04, the SWRCB considered a storm water permit issued to a MS4 that included BMPs as effluent limitations, and did not specifically require compliance with water quality objectives. The SWRCB stated that even where a permit does not specifically reference violation of water quality standards, it should be read "so as to require the implementation of practices which will achieve compliance with applicable standards". Slip op. at 15.

In conclusion, the SWRCB has determined storm water permits for MS4s must include requirements necessary to achieve compliance with both MEP and water quality standards. The SWRCB has allowed RWQCBs to determine the specific requirements to place in permits. The SWRCB has approved permits for MS4s which include BMPs rather than numeric effluent limitations. The SWRCB has also approved a permit that did not specifically

prohibit violation of water quality objectives. The permit was approved because it contained BMPs adequate to meet water quality objectives.

JAN - 9 1991

OFFICE OF GENERAL COUNSEL

MEMORANDUM

SUBJECT: Compliance with Water Quality Standards in NPDES Permits Issued To Municipal Separate Storm Sewer Systems

FROM: E. Donald Elliott
Assistant Administrator and
General Counsel (LE-130)

TO: Nancy J. Marvel
Regional Counsel
Region IX

In your memorandum of August 9, 1990, you have asked for our views on the following two issues:

ISSUES

1) Must NPDES permits for municipal separate storm sewer systems ("MS4s") issued under Section 402(p)(3)(B) of the Clean Water Act (CWA) include requirements necessary to achieve water quality standards (WQS), as generally required by Section 301(b)(1)(C) for all NPDES permits?

2) If permits issued to MS4s must comply with WQS, by what date must the permit ensure compliance?

SHORT ANSWERS

1) The better reading of Sections 402(p)(3)(B) and 301(b)(1)(C) is that all permits for MS4s must include any requirements necessary to achieve compliance with WQS.

2) Sections 402(p)(4)(A) and (p)(4)(B) give "large" and "medium" MS4s three years to comply with permit conditions from the date of permit issuance. This three year compliance date also applies to WQS-based permit requirements.

DISCUSSION

1. Statutory Background

Section 402(a)(1) requires that all NPDES permits comply with the applicable provisions of section 301. This includes compliance with appropriate technology-based standards and effluent limits (sections 301(b)(1)(B), 301(b)(2)). Permits must include "any more stringent limitation" necessary to meet WQS. Section 301(b)(1)(C). In addition, Section 401 requires that any applicant for a federal permit (including NPDES permits issued by EPA) must provide the permitting agency a certification from the State in which the discharge originates that the discharge will comply with the State's WQS.

As part of the 1987 amendments to the Clean Water Act, Congress added Section 402(p) to the Act, related to storm water discharges. Congress exempted some storm water discharges from the requirement to obtain an NPDES permit until after October 1, 1992. Section 402(p)(1). For certain specific categories of storm water discharges, this permit "moratorium" is not in effect, including discharges "associated with industrial activity," discharges from large and medium municipal separate storm sewer systems (i.e., systems serving a population over 250,000 or systems serving a population between 100,000 and 250,000, respectively). Section 402(p)(2).

For industrial and municipal storm water discharges, EPA was instructed to promulgate new regulations specifying permit application requirements. Congress mandated EPA to issue permits no later than February 4, 1991 (for industrial and large municipal discharges) or February 4, 1993 (for medium municipal discharges). Section 402(p)(4). These permits shall provide for compliance "as expeditiously as practicable, but in no event later than 3 years after the date of issuance of such permit." Id.

Section 402(p) also specified the levels of control to be incorporated into storm water permits. Permits for discharges associated with industrial activity are to require compliance with all applicable provisions of Sections 301 and 402 of the CWA, i.e., all technology-based and water quality-based requirements. Section 402(p)(3)(A). By contrast, permits for discharges from municipal separate storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable" ("MEP"). Section 402(p)(3)(B)(iii).

2. Analysis

A. WQ-based Requirements in Municipal Storm Water Permits

The relationship of Section 402(p)(3)(B)(iii) to Section 301(b)(1)(C) is not clear, either on the face of the statute or in legislative history. Section 402(p)(3) is clearly intended to draw a distinction between the requirements on industrial and municipal storm water discharges. Section 402(p)(3)(A) states that industrial discharges shall comply with the applicable provisions of section 301, i.e., BAT/BCT technology-based requirements as well as any more stringent WQ-based requirements pursuant to 301(b)(1)(C). In the next sub-paragraph, Congress requires municipalities to control storm water to the MEP standard; no mention is made of section 301. The juxtaposition of (p)(3)(A) and (p)(3)(B) gives rise to the argument that Congress may have intended to waive all section 301 requirements for municipal discharges in favor of the MEP standard. On the other hand, one could read (p)(3)(B)(iii) as modifying only technology-based requirements for municipal storm water (i.e., MEP substitutes for BAT/BCT); any WQ-based requirements would still be necessary in a municipal permit, even if those requirements are more stringent than "practicable." The legislative history of Section 402(p) provides no guidance as to how Congress intended the MEP standard to operate.

Where Congressional intent behind a statutory provision is ambiguous in light of the language or legislative history, the Agency charged with administering that statute may adopt any reasonable interpretation consistent with the goals and purposes of the statute. Chevron, U.S.A. v. NRDC, 467 U.S. 837 (1984). Therefore, EPA has a large degree of discretion to choose how it will interpret the applicability of WQS to municipal storm water discharges. The only interpretation by EPA to date, contained in its proposed rulemaking, has been that WQS would continue to apply to permits for municipal storm water discharges. See, e.g., 53 Fed. Reg. 49,457 (Dec. 7, 1988) (priorities for controls in municipal storm water management programs will be developed to ensure achievement of water quality standards and the CWA).[1] There has been no intervening interpretation expressed by EPA on this issue. It is the opinion of the Office of General Counsel that the interpretation adopted by the Agency in the proposal is a reasonable one, for the following reasons.

---

[1] EPA's intent to apply WQS to municipal storm water discharges can also be inferred by the fact that the 1988 proposal did not propose to alter 40 CFR 122.44(d), which provides that all NPDES permits must contain water quality-based requirements more stringent than technology-based requirements where necessary to achieve WQS.

First, to support the opposite reading (i.e., that WQ-based requirements do not apply to municipal storm water permits), one would have to assert that Congress implicitly waived section 301(b)(1)(C) requirements for municipal storm water. One would further have to assume that Congress impliedly exempted municipal storm water permits from the Section 401 certification requirements. Implied repeals of statutory provisions are generally disfavored. Morton v. Mancari, 417 U.S. 535, 549 (1974). A court generally will find a statute impliedly repealed only if the later enacted provision is in "irreconcilable conflict" with the earlier provision. Kremer v. Chemical Construction Corp., 456 U.S. 461, 468 (1982) (citations omitted). In this case, the statutory provisions are not in irreconcilable conflict; rather, as discussed above, one may read Section 301(b)(1)(C) as requiring "any more stringent limitation" necessary to meet a WQS in every NPDES permit, including permits for discharges from municipal separate storm sewers which are subject to the MEP standard. Such a reading would harmonize the two provisions and give effect to the policy behind Sections 301(b)(1)(C) and 401, i.e., to ensure that WQS are met, regardless of practical considerations (such as the availability of treatment technology or the "practicability" of MS4 permit requirements).

To read section 402(p)(3)(B) as overriding 301(b)(1)(C) requirements would also cause a conflict between Section 402(p) and the general focus of the provisions in the 1987 Amendments, many of which reflect a Congressional desire to improve compliance with the WQ-based requirements of the Act. The amendments to/additions of sections 303(c)(2)(B), 304(l), 319, 320, 402(o) all reflect Congressional concern with the improvement of water quality through the NPDES and other CWA programs. It would be particularly difficult to argue that the storm water provisions, a major part of the 1987 Amendments, were intended to create an exemption from the general rule regarding WQ-based requirements without an explicit acknowledgment of that result. We think the approach taken in the proposed rule is preferable.

B. Compliance Date for WQ-Based Limits in Municipal Storm Water Permits

In contrast to the issue of whether WQ-based requirements apply at all to MS4s, Congress had indeed spoken to the compliance date issue. Section 402(p)(4) requires compliance with all permit conditions no later than three years from the date of issuance. In light of the express language, we believe the Agency may reasonably interpret the three-year compliance provisions in Section 402(p)(4) to apply to all permit

conditions, including those imposed under 301(b)(1)(C).[2]

There are arguments which support the reasonableness of this interpretation. First, EPA has issued few, if any storm water permits to MS4s to date. Many of these systems will face NPDES permit conditions for the first time, and I understand immediate compliance for these systems is likely to be unrealistic. The compliance date in Section 402(p)(4) apparently reflects a Congressional realization of that reality. Second, EPA has already construed another very similer provision of the 1987 Amendments in the same manner. Section 304(l) establishes an identical three-year compliance date for achieving water quality standards in Individual Control Strategies issued under that section. EPA has interpreted that provision, while not repealing Section 301(b)(1)(C), to allow for three-year compliance with new effluent limits established to meet WQS on 304(l)-identified streams. 54 Fed. Reg. 23,889 (Jun. 2, 1989). Given that 304(l) deals directly with WQ-based standards and permit requirements, a consistent interpretation with respect to 402(p)(3) and (p)(4) (which, as we have seen, is silent on the role of WQ-based requirements for MS4s) is certainly reasonable.[3]

If you have any questions regarding this memorandum, please contact Randy Hill of my staff, FTS 382-7700.

---

[2]. There may be some municipal separate storm sewer systems which are unable to meet even the three-year compliance date in their permits. The Agency retains the discretion to issue an administrative order fixing a schedule for compliance if compliance is not achieved in that three-year period.

[3] The decision of the Administrator in the Star-Kist permit appeal does not affect this analysis. Indeed, the decision itself supports the reading that compliance schedules under Section 304(l) (and, by extension, schedules under Section 402(p)(4)) are unaffected by the holding in that decision. Cf. Order on Petition for Reconsideration, In the Matter of Star-Kist Caribe, Inc., NPDES Appeal No. 88-5, (Apr. 17, 1990), at 6 n.5 (because decision does not prevent all post-1977 compliance schedules, arguments regarding 304(l) are not pertinent); (order stayed Sept. 4 1990).

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
ORDER: WQ 99 - 05

Own Motion Review of the Petition of Environmental Health Coalition
to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740
for Storm Water and Urban Runoff from the Orange County Flood Control District and the
Incorporated Cities of Orange County Within the San Diego Region,
Issued by the California Regional Water Quality Control Board,
San Diego Region.
SWRCB/OCC File A-1041

BY THE BOARD:

In Order WQ 98-01, the State Water Resources Control Board (State Water Board) ordered that certain receiving water limitation language be included in future municipal storm water permits. Following inclusion of that language in permits issued by the San Francisco Bay and San Diego Regional Water Quality Control Boards (Regional Water Boards) for Vallejo and Riverside respectively, the United States Environmental Protection Agency (EPA) objected to the permits. The EPA objection was based on the receiving water limitation language. The EPA has now issued those permits itself and has included receiving water limitation language it deems appropriate.

In light of EPA's objection to the receiving water limitation language in Order WQ 98-01 and its adoption of alternative language, the State Water Board is revising its instructions regarding receiving water limitation language for municipal storm water permits. It is hereby ordered that Order WQ 98-01 will be amended to remove the receiving water limitation language contained therein and to substitute the EPA language. Based on the reasons stated here, and as a precedent decision, the following receiving water limitation language shall be included in future municipal storm water permits.

RECEVING WATER LIMITATIONS

The permittees shall comply with Discharge Prohibitions [ ] and Receiving Water Limitations [ ] through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SWMP and other requirements of this permit including any modifications. The SWMP shall be designed to achieve compliance with Receiving Water Limitations [ ]. If exceedance(s) of water quality objectives or water quality standards (collectively, WQS) persist notwithstanding implementation of the SWMP and other requirements of this permit, the permittees shall assure compliance with Discharge Prohibitions [ ] and Receiving Water Limitations [ ] by complying with the following procedure:

a. Upon a determination by either the permittees or the Regional Water Board that discharges are causing or contributing to an exceedance of an applicable WQS, the permittees shall promptly notify and thereafter submit a report to the Regional Water Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of WQSs. The report may be incorporated in the annual update to the SWMP unless the Regional Water Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Water Board may require modifications to the report.

b. Submit any modifications to the report required by the Regional Water Board within 30 days of notification.

c. Within 30 days following approval of the report described above by the Regional Water Board, the

permittees shall revise the SWMP and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, implementation schedule, and any additional monitoring required.

d. Implement the revised SWMP and monitoring program in accordance with the approved schedule.

So long as the permittees have complied with the procedures set forth above and are implementing the revised SWMP, the permittees do not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Water Board to develop additional BMPs.

ORDER

IT IS ORDERED that Order WQ 98-01 is revised as discussed above.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on June 17, 1999.

Ventura

STATE OF CALIFORNIA

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 00-108 NPDES PERMIT NO. CAS004002
WASTE DISCHARGE REQUIREMENTS
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES
WITHIN
VENTURA COUNTY FLOOD CONTROL DISTRICT,
COUNTY OF VENTURA, AND THE CITIES OF VENTURA COUNTY

FINDINGS

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter called the Regional Board), finds that:

Permit Parties

1. Ventura County Flood Control District (VCFCD), the County of Ventura, and the Cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, San Buenaventura, Santa Paula, Simi Valley, and Thousand Oaks (hereinafter referred to separately as Co-permittees and jointly as the Discharger) have joined together to form the Ventura Countywide Storm Water Quality Management Program to discharge wastes under waste discharge requirements contained in Order No. 94-082, adopted by this Board on July 27, 2000. The Discharger discharges or contributes to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems, into receiving waters of the Santa Clara River, Ventura River, Calleguas Creek, and other coastal watersheds within Ventura County.

2. The Regional Board may require a separate National Pollutant Discharge Elimination System (NPDES) permit for any entity that discharges storm water into coastal watersheds of Ventura County. Such entity can be any State or Federal agency, State or Federal facility, real estate development, waste disposal facility, special district, private interest, etc. Pursuant to 40 CFR 122.26(a), the Regional Board will give these entities the option to become a Co-permittee, after obtaining the concurrence of the Co-permitees, or obtain an individual storm water discharge permit.

Nature of Discharge

3. Storm water discharges consist of surface water runoff generated from various land uses in all the hydrologic drainage basins which discharge into waters of the State. The quality of these discharges varies and is affected by hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary

PART 2 - RECEIVING WATER LIMITATIONS

A. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited.

B. Discharges from the MS4 of storm water, or non-storm water, for which a Discharger is responsible, shall not cause or contribute to a condition of nuisance.

C. The Discharger shall comply with the permit through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the Ventura County SMP and other requirements of this permit including any modifications. The Ventura County SMP shall be designed to achieve compliance with receiving water limitations. If exceedance(s) of water quality objectives or water quality standards persist, notwithstanding implementation of the Ventura County SMP and other requirements of this permit, the Discharger shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

1 Upon a determination by either the Discharger or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard(s), the Discharger shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented, and additional BMPs that will be implemented, to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This report may be included with the Annual Storm Water Report and Assessment, unless the Regional Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Board may require modifications to the report.

2. Submit any modifications to the report required by the Regional Board within 30 days of notification.

3. Within 30 days following the approval of the report, the Discharger shall revise the Ventura County SMP and monitoring program to incorporate the approved, modified suite of BMPs, implementation schedule, and any additional monitoring required.

4. Implement the revised Ventura County SMP and monitoring program according to the approved schedule.

D. So long as the Discharger complies with the procedures set forth above and is implementing the revised Ventura County SMP, the Discharger does not have to repeat the procedure for continuing or recurring exceedances of the same water quality standard(s) unless directed by the Regional Board to develop additional BMPs.

Long Beach

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

ORDER NO. 99-060
NPDES NO. CAS004003 (CI 8052)

WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN CITY OF LONG BEACH

FINDINGS

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board), finds:

Permit Background

1. The City of Long Beach, hereinafter referred to as the Permittee, discharges or contributes to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems, into receiving waters of the Los Angeles Basin.

2. On March 22, 1999, the Permittee submitted a Report of Waste Discharge (ROWD) as an application for issuance of waste discharge requirements and a National Pollutant Discharge Elimination System (NPDES) permit.

3. Municipal storm water discharges from the Permittee's storm drain systems were regulated under countywide waste discharge requirements contained in Order No. 90-079 and Order No. 96-054 adopted by this Regional Board on June 18, 1990, and July 15, 1996, respectively. These Orders serve as an NPDES permit (CA0061654) for the MS4 in Los Angeles County, which is hereby superseded for the City of Long Beach by Order No. CAS004003.

4. The Report of Waste Discharge (ROWD) submitted by the Permittee consists of:

   a. Statement of Accomplishments and Future Goals;
   b. Long Beach Storm Water Management Program; and
   c. Long Beach Monitoring Program;

Requirements

IT IS HEREBY ORDERED that the City of Long Beach, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

Part 1. RECEIVING WATER LIMITATIONS

A. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited.

B. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible shall not cause or contribute to a condition of nuisance.

C. The Permittee shall comply with Part 1 and 2 of the permit through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the LBSWMP and other requirements of this permit including any modifications. The LBSWMP shall be designed to achieve compliance with receiving water limitations. If exceedances of water quality objectives or water quality standards (collectively, water quality standards) persist, notwithstanding implementation of the LBSWMP and other requirements of this permit, the Permittee shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

1. Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, the Permittee shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This report may be incorporated in the annual update of the LBSWMP unless the Regional Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Board may require modifications to the Report.

2. Submit any modifications to the report required by the Regional Board within 30 days of notification

3. Within 30 days following the approval of the report, the Permittee shall revise the LBSWMP and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, implementation schedule, and any

additional monitoring required

4. Implement the revised LBSWMP and monitoring program according to the approved schedule

So long as the Permittee has complied with the procedures set forth above and is implementing the revised LBSWMP, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional BMPs.

Part 2. DISCHARGE PROHIBITIONS

I. Discharge Prohibitions

A. The Permittee shall effectively prohibit non-storm water discharges into the MS4 and watercourses except where such discharges:

1. Are covered by a separate individual or general NPDES permit; or

2. Meet one of the conditions below:

a. Not identified as a source of pollutants:

i. Flows from riparian habitats or wetlands;
ii. Diverted stream flows;
iii. Springs;
iv. Rising ground waters;
v. Uncontaminated groundwater infiltration; and

b. Not Identified as a source of pollutants subject to conditions:

i. Reclaimed and potable landscape irrigation water;
ii. Water line flushing;
iii. Discharges from potable water sources;
iv. Foundation drains;
v. Footing Drains;
vi. Air conditioning condensate;
vii. Water from crawl space pumps
viii. Reclaimed and potable irrigation water;
ix. Reclaimed and potable lawn watering;
x. Dechlorinated swimming pool discharges;
xi. Individual residential car washing; and
xii. Sidewalk washing
xiii. Discharges or flows from emergency fire fighting activities.

If any of the above types of non-storm water discharges (Part 2, I. A.2.b) are determined to be a source of pollutants by the Regional Board Executive Officer, the discharge need not be prohibited if the

Cal Trans

STATE WATER RESOURCES CONTROL BOARD

ORDER NO. 99 - 06 - DWQ
NPDES NO. CAS000003

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT
STATEWIDE STORM WATER PERMIT
AND
WASTE DISCHARGE REQUIREMENTS (WDRs)
FOR THE
STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION (CALTRANS)

The State Water Resources Control Board (SWRCB) finds that:

1. **NPDES PERMIT APPLICATION**: On September 5, 1996, Caltrans, located at 1120 N Street, Sacramento, California 95814 submitted an NPDES Permit application for storm water discharges from the Caltrans highways, properties, facilities, and activities throughout the State of California for Caltrans headquarters and for the District offices including: the North Coast region (District 1), Northern Central Valley and Far Northeastern region (District 2), Sacramento area (District 3), San Francisco Bay area (District 4), Central Coast (District 5), Lower Central Valley (District 6), Los Angeles Basin (District 7), San Bernardino area (District 8), Mono/Inyo area (District 9), Middle Central Valley (District 10), San Diego area (District 11), and Orange County (District 12). The application was accepted on October 4, 1996. As part of the application, Caltrans submitted a Storm Water Management Plan (SWMP) and Monitoring Plan. The SWMP and Monitoring Plan were amended in March 1997 and again in April 1998. The application is considered an application for permit reissuance because Caltrans is currently under permit in all of the parts of the State for which a Municipal Separate Storm Sewer System (MS4) permit is currently required. The MS4 permits that Caltrans holds, the permitting agency, the adoption date, and expiration date are shown in Table 1.

//

//

//

//

//

//

//

//

shall conduct a follow-up investigation to identify the source of the elevated pollutants.

8. Discharges or flows from health and safety emergencies, such as fire fighting activities and accident response, shall be addressed only when such flows are identified by Caltrans to be significant sources of pollutants to waters of the United States. *(It is not the intention of the SWRCB for Caltrans to prohibit, under any circumstances, the discharge of water or other fire retardants that flow into storm water conveyance systems as a result of their use for protection of life and public or private property. However, there may be instances when specified BMPs are appropriate for fire fighting flows).* Although this NPDES Permit does not prohibit these discharges, they may still be subject to regulation under the federal and/or State law.

9. Caltrans shall submit a ***COMPREHENSIVE NONSTORM WATER REPORT*** each year as part of the Annual Report. This report shall include the analysis of each category of discharge, and the BMPs to be implemented for each category. Caltrans must also periodically evaluate the effectiveness of the modified BMPs by examining illicit discharge/illegal dumping investigation results and take any further action necessary to reduce such pollutant concentrations.

C. RECEIVING WATER LIMITATIONS

C-1- RECEIVING WATER LIMITATIONS FOR MUNICIPAL ACTIVITIES:

1. The discharge of storm water from a facility or activity that causes or contributes to the violation of water quality standards or water quality objectives (collectively WQSs) is prohibited.

2. The discharges shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

   a. Floating, suspended solids, or deposited macroscopic particulate matter, or foam;

   b. Bottom deposits or aquatic growths;

   c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;

   d. Visible, floating, suspended, or deposited oil or other products of petroleum origin, and /or;

   e. Toxic or deleterious substances present in concentrations or quantities which will cause deleterious effects on aquatic biota, wildlife, or waterfowl, or which render any of these unfit for human consumption

Cal Trans

either at levels created in the receiving waters or as a result of biological concentration.

3. Caltrans shall comply with Parts C-1.1. and 2. of this permit through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SWMP and other requirements of this permit including any modifications; the SWMP shall be designed to achieve compliance with Parts C-1.1. and 2. of this permit; if exceedance(s) of WQSs persist notwithstanding implementation of the SWMP and other requirements of this permit, the permittee shall assure compliance with Parts C-1.1. and 2. of this permit by complying with the following procedure:

   a. Upon a determination by either Caltrans or the RWQCB that discharges are causing or contributing to an exceedance of an applicable WQS, Caltrans shall promptly notify and thereafter submit a report to the appropriate RWQCB. The report shall describe BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of water quality standards. The report may be incorporated in the annual update to the SWMP unless the RWQCB directs an earlier submittal. The report shall include an implementation schedule. The RWQCB may require modifications to the report;

   b. Submit any modifications to the report required by the RWQCB within 30 days of notification;

   c. Within 30 days following approval of the report described above by the RWQCB, Caltrans shall revise the SWMP and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, the implementation schedule, and any additional monitoring required; and

   d. Implement the revised SWMP and monitoring program in accordance with the approved schedule.

4. So long as Caltrans has complied with the procedures set forth in Receiving Water Limitations C-1-3. above and are implementing the revised SWMP, Caltrans does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the RWQCB to develop additional BMPs.

C-2-RECEIVING WATER LIMITATIONS FOR CONSTRUCTION ACTIVITIES:

1. Storm water discharges and authorized nonstorm water discharges to any surface or ground water shall not adversely impact human health or the environment.

2. The SWPPP developed for the construction activity covered by this NPDES Permit

Cal Trans

shall be designed and implemented such that storm water discharges and authorized nonstorm water discharges shall not cause or contribute to an exceedance of any applicable water quality standards contained in a Statewide Water Quality Control Plan and/or the applicable RWQCB's Basin Plan.

3. Should it be determined by Caltrans, SWRCB or RWQCB staff that storm water discharges and/or authorized nonstorm water discharges are causing or contributing to an exceedance of an applicable water quality standard, Caltrans shall:

   a. Implement corrective measures immediately following discovery that water quality standards were exceeded, followed by notification of the RWQCB by telephone as soon as possible but no later than 48 hours after the discharge has been discovered. This notification shall be followed by a report within 14 days to the appropriate RWQCB, unless otherwise directed by the RWQCB, describing (1) the nature and case of the water quality standard exceedance; (2) the BMPs currently being implemented; (3) any additional BMPs which will be implemented to prevent or reduce pollutants that are causing or contributing to the exceedance of water quality standards; and (4) any maintenance or repair of BMPs. This report shall include an implementation schedule for corrective actions and shall describe the actions taken to reduce the pollutants causing or contributing to the exceedance.

   b. Caltrans shall revise its SWPPP and monitoring program immediately after the report to the RWQCB to incorporate the additional BMPs that have been and will be implemented, the implementation schedule, and any additional monitoring needed.

   c. Nothing in this section shall prevent the appropriate RWQCB from enforcing any provisions of this permit while Caltrans prepares and implements the above report.

D. RWQCB AUTHORITIES

1. Following adoption of this permit, RWQCBs shall implement the Provisions of this permit. Implementation of this permit may include, but is not limited to, reviewing SWPPPs, reviewing Maintenance Facility Pollution Prevention Plans (FPPPs), reviewing monitoring reports, conducting compliance inspections, conducting monitoring, reviewing the Annual Reports and taking enforcement actions.

2. RWQCBs may require submittal of, require changes to, specify a format for, and enforce Provisions of SWPPPs and FPPPs. RWQCBs may also designate projects which do not meet the acreage requirements based upon water quality concerns and require SWPPPs. RWQCBs may require that Caltrans submit all SWPPPs automatically up to 30 days in advance of the onset of construction.

3. RWQCBs may require retention of records for more than three years.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN DIEGO REGION
ORDER NO. 2001-01
NPDES NO. CAS0108758

WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF URBAN RUNOFF FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF THE COUNTY OF SAN DIEGO, THE INCORPORATED CITIES OF SAN DIEGO COUNTY, AND THE SAN DIEGO UNIFIED PORT DISTRICT

The California Regional Water Quality Control Board, San Diego Region (hereinafter SDRWQCB), finds that:

1. **COPERMITTEES ARE DISCHARGERS OF URBAN RUNOFF:** Each of the persons in Table 1 below, hereinafter called Copermittees or dischargers, owns or operates a municipal separate storm sewer system (MS4), through which it discharges urban runoff into waters of the United States within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the United States.

Table 1. Municipal Copermittees

1.	City of Carlsbad	11.	City of National City
2.	City of Chula Vista	12.	City of Oceanside
3.	City of Coronado	13.	City of Poway
4.	City of Del Mar	14.	City of San Diego
5.	City of El Cajon	15.	City of San Marcos
6.	City of Encinitas	16.	City of Santee
7.	City of Escondido	17.	City of Solana Beach
8.	City of Imperial Beach	18.	City of Vista
9.	City of La Mesa	19.	County of San Diego
10.	City of Lemon Grove	20.	San Diego Unified Port District

2. **URBAN RUNOFF IS A "WASTE" AND A "POINT SOURCE DISCHARGE OF POLLUTANTS":** Urban runoff is a waste, as defined in the California Water Code, that contains pollutants and adversely affects the quality of the waters of the State. The discharge of urban runoff from an MS4 is a "discharge of pollutants from a point source" into waters of the United States as defined in the Clean Water Act.

3. **URBAN DEVELOPMENT AND RUNOFF CAUSES RECEIVING WATER DEGRADATION:** Urban runoff discharges from MS4s are a leading cause of receiving water quality impairment in the San Diego Region and throughout the United States. As runoff flows over urban areas, it picks up harmful pollutants such as pathogens, sediment (resulting from human activities), fertilizers, pesticides, heavy metals, and petroleum products. These pollutants often become dissolved or suspended in urban runoff and are conveyed and discharged to receiving waters, such as streams, lakes, lagoons, bays, and the ocean without treatment. Once in receiving waters, these pollutants harm aquatic life primarily through toxicity and habitat degradation.

k. Water line flushing;
l. Landscape irrigation;
m. Discharges from potable water sources other than water main breaks;
n. Irrigation water;
o. Lawn watering;
p. Individual residential car washing; and
q. Dechlorinated swimming pool discharges.

3. When a discharge category above is identified as a significant source of pollutants to waters of the United States, the Copermittee shall either:

   a. Prohibit the discharge category from entering its MS4; ***OR***

   b. Not prohibit the discharge category and implement, or require the responsible party(ies) to implement, BMPs which will reduce pollutants to the MEP; ***AND***

   c. For each discharge category not prohibited, the Copermittee shall submit the following information to the SDRWQCB within **365 days** of adoption of this Order:

      (1) The non-storm water discharge category listed above which the Copermittee elects not to prohibit; and

      (2) The BMP(s) for each discharge category listed above which the Copermittee will implement, or require the responsible party(ies) to implement, to prevent or reduce pollutants to the MEP.

4. **Fire Fighting Flows:** Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited. As part of the Jurisdictional URMP, each Copermittee shall develop and implement a program within 365 days of adoption of this Order to reduce pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes and maintenance activities) identified by the Copermittee to be significant sources of pollutants to waters of the United States.

5. **Dry Weather Analytical Monitoring and Non-Storm Water Discharges:** Each Copermittee shall examine all dry weather analytical monitoring results collected in accordance with section F.5. and Attachment E of this Order to identify water quality problems which may be the result of any non-prohibited discharge category(ies) identified above in Non-Storm Water Discharges to MS4s Prohibition B.2. Follow-up investigations shall be conducted as necessary to identify and control any non-prohibited discharge category(ies) listed above.

C. RECEIVING WATER LIMITATIONS

1. Discharges from MS4s that cause or contribute to the violation of water quality standards (designated beneficial uses and water quality objectives developed to protect beneficial uses) are prohibited.

2. Each Copermittee shall comply with Part C.1. of this Order through timely implementation of control measures and other actions to reduce pollutants in urban runoff discharges in accordance with the Jurisdictional Urban Runoff Management Program (Jurisdictional URMP) and other requirements of this Order including any modifications. The Jurisdictional URMP shall be designed to achieve compliance with Part C.1. of this Order. If exceedance(s) of water quality standards persist notwithstanding implementation of the URMP and other requirements of this Order, the Copermittee shall assure compliance with Part C.1. of this Order by complying with the following procedure:

   a. Upon a determination by either the Copermittee or the SDRWQCB that MS4 discharges are causing or contributing to an exceedance of an applicable water quality standard, the

Copermittee shall promptly notify and thereafter submit a report to the SDRWQCB that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of water quality standards. The report may be incorporated in the annual update to the Jurisdictional URMP unless the SDRWQCB directs an earlier submittal. The report shall include an implementation schedule. The SDRWQCB may require modifications to the report;

b. Submit any modifications to the report required by the SDRWQCB within 30 days of notification;

c. Within 30 days following approval of the report described above by the SDRWQCB, the Copermittee shall revise its Jurisdictional URMP and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, the implementation schedule, and any additional monitoring required;

d. Implement the revised Jurisdictional URMP and monitoring program in accordance with the approved schedule.

So long as the Copermittee has complied with the procedures set forth above and are implementing the revised Jurisdictional URMP, the Copermittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the SDRWQCB to do so.

3. Nothing in this section shall prevent the SDRWQCB from enforcing any provision of this Order while the Copermittee prepares and implements the above report.

D. LEGAL AUTHORITY

1. Each Copermittee shall establish, maintain, and enforce adequate legal authority to control pollutant discharges **into** and **from** its MS4 through ordinance, statute, permit, contract or similar means. This legal authority must, at a minimum, authorize the Copermittee to:

   a. Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity **to** its MS4 and control the quality of runoff **from** industrial and construction sites. This requirement applies both to industrial and construction sites which have coverage under the statewide general industrial or construction storm water permits, as well as to those sites which do not. Grading ordinances shall be upgraded and enforced as necessary to comply with this Order.

   b. Prohibit **all** identified illicit discharges not otherwise allowed pursuant to section B.2 including but not limited to:

      (1) Sewage;

      (2) Discharges of wash water resulting from the hosing or cleaning of gas stations, auto repair garages, or other types of automotive services facilities;

      (3) Discharges resulting from the cleaning, repair, or maintenance of any type of equipment, machinery, or facility including motor vehicles, cement-related equipment, and port-a-potty servicing, etc.;

      (4) Discharges of wash water from mobile operations such as mobile automobile washing, steam cleaning, power washing, and carpet cleaning, etc.;

      (5) Discharges of wash water from the cleaning or hosing of impervious surfaces in municipal, industrial, commercial, and residential areas including parking lots, streets, sidewalks, driveways, patios, plazas, work yards and outdoor eating or drinking areas,

Region 2

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

ORDER NO. 01-024
NPDES PERMIT NO. CAS029718

REISSUING WASTE DISCHARGE REQUIREMENTS FOR:

SANTA CLARA VALLEY WATER DISTRICT, COUNTY OF SANTA CLARA, CITY OF CAMPBELL, CITY OF CUPERTINO, CITY OF LOS ALTOS, TOWN OF LOS ALTOS HILLS, TOWN OF LOS GATOS, CITY OF MILPITAS, CITY OF MONTE SERENO, CITY OF MOUNTAIN VIEW, CITY OF PALO ALTO, CITY OF SAN JOSE, CITY OF SANTA CLARA, CITY OF SARATOGA, AND CITY OF SUNNYVALE, which have joined together to form the SANTA CLARA VALLEY URBAN RUNOFF POLLUTION PREVENTION PROGRAM

The California Regional Water Quality Control Board, San Francisco Bay Region, (hereinafter referred to as the Regional Board) finds that:

1. The Santa Clara Valley Water District (hereinafter District), County of Santa Clara, City of Campbell, City of Cupertino, City of Los Altos, Town of Los Altos Hills, Town of Los Gatos, City of Milpitas, City of Monte Sereno, City of Mountain View, City of Palo Alto, City of San Jose, City of Santa Clara, City of Saratoga, and City of Sunnyvale (hereinafter referred to as the Dischargers) have joined together to form the Santa Clara Valley Urban Runoff Pollution Prevention Program (hereinafter referred to as the Program) and have submitted a permit application (Report of Waste Discharge), dated December 21, 1999, for re-issuance of waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES) to discharge stormwater run off from storm drains and watercourses within the Dischargers' jurisdictions.

2. The Dischargers are currently subject to NPDES Permit No.CAS029718 issued by Order No. 95-180 on August 23, 1995, and modified by Order No. 99-050 on July 21, 1999.

3. The Dischargers each have jurisdiction over and/or maintenance responsibility for their respective municipal separate storm drain systems and/or watercourses in the Santa Clara basin. (See attached location and political jurisdiction map.) The basin can be divided into eleven sub basins or watersheds including the Coyote Creek watershed on the east side of the valley, the Guadalupe River watershed which drains the south-central portion of the valley, the San Francisquito Creek watershed which drains the northwest portion of the valley (and part of San Mateo County), and a series of small, relatively urbanized watersheds that drain the west side of the valley. (See attached basin watersheds map.) Discharge consists of the surface runoff generated from various land uses in all the hydrologic sub basins in the basin which discharge into watercourses, which in turn flow into South San Francisco Bay.

   The quality and quantity of these discharges varies considerably and is affected by hydrology, geology, land use, season, and sequence and duration of hydrologic event. Pollutants of concern in these discharges are certain heavy metals, excessive sediment production from erosion due to anthropogenic activities, petroleum hydrocarbons from sources such as used motor oil, microbial

30. It is the intention of the Regional Board that this Order supersedes Order Nos. 90-094, 92-021, 93-164, 95-180, and 99-050.

31. This Order serves as a NPDES permit, pursuant to CWA Section 402, or amendments thereto, and shall become effective ten days after the date of its adoption provided the Regional Administrator, US EPA, Region IX, has no objections.

IT IS HEREBY ORDERED that the Dischargers, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted hereunder and the provisions of the Clean Water Act as amended and regulations and guidelines adopted hereunder, shall comply with the following:

A. DISCHARGE PROHIBITION

The Dischargers shall, within their respective jurisdictions, effectively prohibit the discharge of non-stormwater (materials other than stormwater) into the storm drain systems and watercourses. NPDES permitted discharges are exempt from this prohibition. Compliance with this prohibition shall be demonstrated in accordance with Provision C.1 and C.8 of this Order. Provision C.8 describes a tiered categorization of non-stormwater discharges based on potential for pollutant content.

B. RECEIVING WATER LIMITATIONS

1. The discharge shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

   a. Floating, suspended, or deposited macroscopic particulate matter, or foam;

   b. Bottom deposits or aquatic growths;

   c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;

   d. Visible, floating, suspended, or deposited oil or other products of petroleum origin; and/or

   e. Substances present in concentrations or quantities which will cause deleterious effects on aquatic biota, wildlife, or waterfowl, or which render any of these unfit for human consumption.

2. The discharge shall not cause or contribute to a violation of any applicable water quality standard for receiving waters contained in the Regional Board Basin Plan. If applicable water quality objectives are adopted and approved by the State Board after the date of the adoption of this Order, the Regional Board may revise and modify this Order as appropriate.

C. PROVISIONS

1. The Dischargers shall comply with Discharge Prohibition A and Receiving Water Limitations B.1 and B.2 through the timely implementation of control measures and other actions to reduce pollutants in the discharge in accordance with the Management Plan and other requirements of

this permit, including any modifications. The Management Plan shall be designed to achieve compliance with Receiving Water Limitations B.1 and B.2. If exceedance(s) of water quality standards or water quality objectives (collectively WQSs) persist notwithstanding implementation of the Management Plan, a Discharger shall assure compliance with Discharge Prohibition A.1 and Receiving Water Limitations B.1 and B.2 by complying with the following procedure:

a. Upon a determination by either the Discharger(s) or the Regional Board that discharges are causing or contributing to an exceedance of an applicable WQS, the Discharger(s) shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of WQSs. The report may be incorporated in the annual update to the Management Plan unless the Regional Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Board may require modifications to the report;

b. Submit any modifications to the report required by the Regional Board within 30 days of notification;

c. Within 30 days following approval of the report described above by the Regional Board, the Dischargers shall revise the Management Plan and monitoring program to incorporate the approved modified control measures that have been and will be implemented, the implementation schedule, and any additional monitoring required;

d. Implement the revised Management Plan and monitoring program in accordance with the approved schedule.

As long as Dischargers have complied with the procedures set forth above and are implementing the revised Management Plan, they do not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional control measures and BMPs.

2. Urban Runoff Management Plan and Performance Standards

a. The Dischargers shall implement control measures and best management practices to reduce pollutants in stormwater discharges to the maximum extent practicable. The Management Plan shall serve as the framework for identification, assignment, and implementation of such control measures/BMPs. The Management Plan contains Performance Standards that address the following Program elements: Illicit Connection/Illegal Discharge Control; Industrial/Commercial Discharger Control; Public Streets, Roads, and Highways Operation and Maintenance; Storm Drain Operation and Maintenance; Water Utility Operation and Maintenance; and New Development Planning Procedures and Construction Inspection. Performance Standards are defined as the level of implementation necessary to demonstrate the control of pollutants in stormwater to the maximum extent practicable. The Dischargers shall implement the Management Plan, and shall, through its continuous improvement process[4], subsequently demonstrate its effectiveness and provide for necessary and

[4] Continuous Improvement shall be defined as seeking new opportunities for improving Program effectiveness, controlling stormwater pollution, and, protecting beneficial uses. The Program's approach to implementing Performance Standards explicitly

A Case for Inspection Requirements at Industrial and Other High Priority Facilities under the LA County MS4 Permit

Requirement	Citation
"Today's rule also requires the municipal storm sewer permittee to describe **a program to address industrial discharges** that are covered under the municipal storm sewer permit. Today's rule requires the municipal applicant to identify such discharges..., provide a description of a program to monitor pollutants in runoff from certain industrial facilities that discharge to the municipal storm sewer system, **identify priorities and procedures for inspections**, and **establish and implement control measures for such discharges**."	Final Rule (Federal Register, Vol. 55, p. 48056)
Part 2 application requirement: [The applicant must demonstrate that it can control through] Adequate Legal Authority which authorizes or enables at a minimum to: **Control** through **ordinance, permit, contract, order or similar means**, the **contribution of pollutants** to the municipal storm sewer by **storm water discharges associated with industrial activity** and the quality of **storm water discharged from sites of industrial activity**;	40 CFR 122.26(d)(2)(i)(A)
Carry out all inspection, **surveillance** and **monitoring** procedures necessary to **determine compliance and noncompliance** with **permit conditions *including*** the prohibition on illicit discharges to the municipal separate storm sewer.	40 CFR 122.26(d)(2)(i)(F)
In part 2 of the application, municipal applicants **must demonstrate** that **they now possess adequate legal authority** to: • **Control** construction site and **other industrial discharges** to the MS4;... • **Control potential sources of pollutants from discharges to or from** coapplicants' MS4s, or MS4s that are interconnected or shared with other entities;... • **Carry out inspection, surveillance, and monitoring** procedures.	Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems (Guidance Manual) USEPA 1992 Pag. 3-1
"Control"[...] means not only to require disclosure of information, but **also** to **limit, discourage, or terminate** a storm water discharge to the MS4.	Guidance Manual pag. 3-1
However, a municipality, to satisfy its permit conditions, **may need to impose additional requirements** on **discharges from permitted industrial facilities**, **as well as discharges from industrial facilities** and construction sites ***not* required to obtain permits**.	Guidance Manual pag. 3-1
In their part 2 applications, municipalities must propose programs to **control** the contributions of pollutants from industrial facilities **and prohibit** illicit discharges. For **both** of these activities, municipalities **must have the legal authority** to **carry out inspection, surveillance, and monitoring** procedures necessary to **determine compliance**.	Guidance Manual pag. 3-3
In their part 2 applications, municipalities should provide documentation of **their authority to enter, sample, inspect, review, and copy records,** etc. as well as demonstrate their authority to require regular reports.	Guidance Manual pag. 3-3
A description of **a program** to **monitor and control pollutants** in storm water discharges to municipal systems from **municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA),** and ***industrial facilities that the municipal permit applicant***	40 CFR 122.26(d)(2)(iv)(C) **R0003233**

Requirement	Citation
determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program **shall**: (1) **Identify priorities and procedures for inspections** and **establishing and implementing control measures** for such discharges;	
NPDES permits for MS4s will establish *responsibilities* for municipal system operators to control pollutants from industrial storm water discharged through their system.	Guidance Manual pag. 6-16
Proposed storm water management programs must address the reduction of pollutants in storm water discharges from **municipal landfills, hazardous waste treatment, disposal and recovery facilities, facilities subject to SARA Title III;** and ***other priority industrial facilities***, as determined by the applicant. **Municipalities should consider** the information gathered for [..] the part 2 application (**particularly the Source Identification and Characterization Data** components) when prioritizing storm water discharges from these sites.	Guidance Manual pag. 6-16
In part 2 application, the Source Identification component requires the applicant to provide **an inventory of pollutant sources**, organized by watershed. This inventory **identifies and describes the products and services** of each industrial facility that may discharge storm water to the MS4. The Source identification component suggests applicants to use standard industrial classification codes (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites ***that do not meet*** the ***regulatory definition of "storm water discharge associated with industrial activity"*** (i.e. not included in the Source Identification and Discharge Characterization components), but ***are identified as a high priority*** under the proposed management program.	Guidance Manual pag. 6-16 [Commercial Sites]
The municipality is **ultimately responsible** for discharges from their MS4. Consequently, the proposed storm water management program should describe how **the municipality will help** EPA and authorized NPDES States: • **Identify priority industries** discharging to their systems; • **Review. and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;** • **Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them);** and • ***Inspect*** **and monitor industrial facilities *to verify* that the industries discharging storm water to the municipal systems *are in compliance with their NPDES storm water permit***, if required.	Guidance Manual pag. 6-17
At a minimum, priority facilities include: • Operating and closed municipal landfills; • Hazardous waste treatment, disposal or recovery facilities; and • Facilities subject to SARA Title III. Municipalities must identify these **and *other priority industrial facilities***	Guidance Manual pag. 6-17 **R0003234**

Requirement	Citation
and describe the criteria used to identify them. For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. **Other sources** may include CWA Section 205 or 208 use-attainability studies, other studies that **indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall**, or **records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or a major contribution of pollutants**. The program should also describe procedures for modifying the inventory of priority industries based on **additional evaluation** that occurs throughout the permit term.	
During the term of the permit, as additional information becomes available, **the municipality should target and set priorities for other program elements** that emerge.	Guidance Manual pag. 6-18
As noted above, when identifying priority sites, applicants must consider all the facilities listed in 122.26(d)(2)(iv)(C)(1). When municipalities develop criteria for **identifying additional priority industrial facilities**, they are advised to consider, **at a minimum:** • The **type of industrial activity** (SIC codes can help characterize the type of industrial activity); • The **use and management of chemicals or raw products** at the facility and **the likelihood** that storm water discharge from the site **will be contaminated**; and • The **size and location of the facility in relation to sensitive watersheds.**	Guidance Manual pag. 6-18
The proposed management program **must include procedures for inspecting priority industrial sites**. The results of inspection may be used as a basis for **requiring storm water management controls and enhanced pollution prevention measures**. It should also establish an **inspection schedule** for each priority facility at the time it is identified.	Guidance Manual pag. 6-18
Applicants also should describe a procedure for **conducting follow-up inspections**, where necessary, as part of this program component. For example, follow-up inspections **might be needed to verify the installation of a specific control or implementation of a practice specified** in a negotiated agreement between the municipality and the industrial site. A system-wide approach to establishing priorities for inspection procedures is recommended. The system-wide approach should begin with the evaluation of existing information, followed by the identification and evaluation of new information during the permit term. Therefore, applicants **should link** these procedures with information from the Source Identification and Discharge Characterization components.	Guidance Manual pag. 6-19
A municipality **must consider** if it **should place more stringent controls on discharges associated with industrial activity than are required in an industrial facility's existing NPDES storm water permit.**	Guidance Manual pag. 6-19
Priority industrial facilities should focus on controlling activities such as	Guidance Manual pag. 6-19

Requirement	Citation
the use, storage, and handling of toxic chemicals. Standard methods for implementing control measures at different types of facilities should be described. To facilitate this, municipalities **should obtain copies of the pollution prevention plans developed by industrial permittees**. **Control measures** that the municipality **may suggest include preventing exposure of pollutant sources to precipitation, on-site pretreatment, and oil/water separators.**	
The proposed management program **should describe the inspection procedures that will be followed. Storm water inspections can be coupled with inspections for other purposes** (e.g., pretreatment programs, fire and safety). Proposed management **programs should address minimum frequency for routine inspections**. For example, **how often, how much of the site, and how long an inspection may take** are appropriate to explain in this proposed management program component. Applicants should also describe **procedures for conducting inspections and provide an inspector's checklist**. In addition, these inspection procedures should identify the **minimum number of inspectors** that will be employed and **describe the programs to train them**.	Guidance Manual pag. 6-19
Municipalities are **urged to *evaluate* pollution prevention plans and discharge monitoring data collected by the industrial facility to *ensure* that the facility is *in compliance with its NPDES storm water permit. Site inspections* should include (1) *an evaluation of the pollution prevention plan*** and any other pertinent documents, **and (2) an *on-site visual inspection of the facility*** to ***evaluate the potential* for *discharges of contaminated storm water*** from the site and ***to assess the effectiveness of the pollution prevention plan.***	Guidance Manual pag. 6-20

R0003236

From 40 CFR (Code of Federal Regulations)

any warm or cold water aquatic animal production facility as a concentrated aquatic animal production facility upon determining that it is a significant contributor of pollution to waters of the United States. In making this designation the Director shall consider the following factors:

(i) The location and quality of the receiving waters of the United States;

(ii) The holding, feeding, and production capacities of the facility;

(iii) The quantity and nature of the pollutants reaching waters of the United States; and

(iv) Other relevant factors.

(2) A permit application shall not be required from a concentrated aquatic animal production facility designated under this paragraph until the Director has conducted on-site inspection of the facility and has determined that the facility should and could be regulated under the permit program.

[48 FR 14153, Apr. 1, 1983, as amended at 65 FR 30907, May 15, 2000]

§ 122.25 Aquaculture projects (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* Discharges into aquaculture projects, as defined in this section, are subject to the NPDES permit program through section 318 of CWA, and in accordance with 40 CFR part 125, subpart B.

(b) *Definitions.* (1) *Aquaculture project* means a defined managed water area which uses discharges of pollutants into that designated area for the maintenance or production of harvestable freshwater, estuarine, or marine plants or animals.

(2) *Designated project area* means the portions of the waters of the United States within which the permittee or permit applicant plans to confine the cultivated species, using a method or plan or operation (including, but not limited to, physical confinement) which, on the basis of reliable scientific evidence, is expected to ensure that specific individual organisms comprising an aquaculture crop will enjoy increased growth attributable to the discharge of pollutants, and be harvested within a defined geographic area.

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* (1) Prior to October 1, 1994, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity (see § 122.26(a)(4));

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at § 122.2.

The Director may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director may consider the following factors:

(A) The location of the discharge with respect to waters of the United States as defined at 40 CFR 122.2.

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from mining operations or oil and gas exploration, production, processing or treatment operations or

transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that has not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(3) *Large and medium municipal separate storm sewer systems.* (i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to: all discharges owned or operated by the same municipality; located within the same jurisdiction; all discharges within a system that discharge to the same watershed; discharges within a system that are similar in nature; or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system;

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible; or

(C) A regional authority may be responsible for submitting a permit application under the following guidelines:

(*1*) The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due;

(*2*) The permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application;

(*3*) Each of the operators of municipal separate storm sewers within the systems described in paragraphs (b)(4) (i), (ii), and (iii) or (b)(7) (i), (ii), and (iii) of this section, that are under the purview of the designated regional authority, shall comply with the application requirements of paragraph (d) of this section.

(iv) One permit application may be submitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all, or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(4) *Discharges through large and medium municipal separate storm sewer systems.* In addition to meeting the requirements of paragraph (c) of this section, an operator of a storm water discharge associated with industrial activity which discharges through a large or medium municipal separate storm sewer system shall submit, to the operator of the municipal separate storm sewer system receiving the discharge no later than May 15, 1991, or 180 days prior to commencing such discharge:

60

the name of the facility; a contact person and phone number; the location of the discharge; a description, including Standard Industrial Classification, which best reflects the principal products or services provided by each facility; and any existing NPDES permit number.

(5) *Other municipal separate storm sewers.* The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges.

(6) *Non-municipal separate storm sewers.* For storm water discharges associated with industrial activity from point sources which discharge through a non-municipal or non-publicly owned separate storm sewer system, the Director, in his discretion, may issue: a single NPDES permit, with each discharger a co-permittee to a permit issued to the operator of the portion of the system that discharges into waters of the United States; or, individual permits to each discharger of storm water associated with industrial activity through the non-municipal conveyance system.

(i) All storm water discharges associated with industrial activity that discharge through a storm water discharge system that is not a municipal separate storm sewer must be covered by an individual permit, or a permit issued to the operator of the portion of the system that discharges to waters of the United States, with each discharger to the non-municipal conveyance a co-permittee to that permit.

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must submit applications.

(iii) Any permit covering more than one operator shall identify the effluent limitations, or other permit conditions, if any, that apply to each operator.

(7) *Combined sewer systems.* Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must obtain NPDES permits in accordance with the procedures of §122.21 and are not subject to the provisions of this section.

(8) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under title II, title III or title VI of the Clean Water Act. *See* 40 CFR part 35, subpart I, appendix A(b)H.2.j.

(9)(i) On and after October 1, 1994, for discharges composed entirely of storm water, that are not required by paragraph (a)(1) of this section to obtain a permit, operators shall be required to obtain a NPDES permit only if:

(A) The discharge is from a small MS4 required to be regulated pursuant to §122.32;

(B) The discharge is a storm water discharge associated with small construction activity pursuant to paragraph (b)(15) of this section;

(C) The Director, or in States with approved NPDES programs either the Director or the EPA Regional Administrator, determines that storm water controls are needed for the discharge based on wasteload allocations that are part of "total maximum daily loads" (TMDLs) that address the pollutant(s) of concern; or

(D) The Director, or in States with approved NPDES programs either the Director or the EPA Regional Administrator, determines that the discharge, or category of discharges within a geographic area, contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(ii) Operators of small MS4s designated pursuant to paragraphs (a)(9)(i)(A), (a)(9)(i)(C), and (a)(9)(i)(D) of this section shall seek coverage under an NPDES permit in accordance with §§122.33 through 122.35. Operators of non-municipal sources designated pursuant to paragraphs (a)(9)(i)(B), (a)(9)(i)(C), and (a)(9)(i)(D) of this section shall seek coverage under an NPDES permit in accordance with paragraph (c)(1) of this section.

(iii) Operators of storm water discharges designated pursuant to paragraphs (a)(9)(i)(C) and (a)(9)(i)(D) of this section shall apply to the Director for a permit within 180 days of receipt

of notice, unless permission for a later date is granted by the Director (see § 124.52(c) of this chapter).

(b) *Definitions.* (1) *Co-permittee* means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

(2) *Illicit discharge* means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

(3) *Incorporated place* means the District of Columbia, or a city, town, township, or village that is incorporated under the laws of the State in which it is located.

(4) *Large municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 250,000 or more as determined by the 1990 Decennial Census by the Bureau of the Census (Appendix F of this part); or

(ii) Located in the counties listed in appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; and

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4) (i), (ii), (iii) of this section.

(5) *Major municipal separate storm sewer outfall* (or "major outfall") means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

(6) *Major outfall* means a major municipal separate storm sewer outfall.

(7) *Medium municipal separate storm sewer system* means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the 1990 Decennial Census by the Bureau of the Census (Appendix G of this part); or

(ii) Located in the counties listed in appendix I, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(7) (i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm

62

sewer and the discharges from municipal separate storm sewers described under paragraph (b)(7) (i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a medium municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (b)(7) (i), (ii), (iii) of this section.

(8) *Municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(9) *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) *Overburden* means any material of any nature, consolidated or unconsolidated, that overlies a mineral deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations.

(11) *Runoff coefficient* means the fraction of total rainfall that will appear at a conveyance as runoff.

(12) *Significant materials* includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101(14) of CERCLA; any chemical the facility is required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

(13) *Storm water* means storm water runoff, snow melt runoff, and surface runoff and drainage.

(14) *Storm water discharge associated with industrial activity* means the discharge from any conveyance that is used for collecting and conveying storm water and that is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under this part 122. For the categories of industries identified in this section, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or

by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at part 401 of this chapter); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and final products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the purposes of this paragraph, material handling activities include storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are federally, State, or municipally owned or operated that meet the description of the facilities listed in paragraphs (b)(14)(i) through (xi) of this section) include those facilities designated under the provisions of paragraph (a)(1)(v) of this section. The following categories of facilities are considered to be engaging in "industrial activity" for purposes of paragraph (b)(14):

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) in paragraph (b)(14) of this section);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; (inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator; inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined materials, nor sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim);

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221–25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation,

64

mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (b)(14) (i)-(vii) or (ix)-(xi) of this section are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with section 405 of the CWA;

(x) Construction activity including clearing, grading and excavation, except operations that result in the disturbance of less than five acres of total land area. Construction activity also includes the disturbance of less than five acres of total land area that is a part of a larger common plan of development or sale if the larger common plan will ultimately disturb five acres or more;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, and 4221-25;

(15) *Storm water discharge associated with small construction activity* means the discharge of storm water from:

(i) Construction activities including clearing, grading, and excavating that result in land disturbance of equal to or greater than one acre and less than five acres. Small construction activity also includes the disturbance of less than one acre of total land area that is part of a larger common plan of development or sale if the larger common plan will ultimately disturb equal to or greater than one and less than five acres. Small construction activity does not include routine maintenance that is performed to maintain the original line and grade, hydraulic capacity, or original purpose of the facility. The Director may waive the otherwise applicable requirements in a general permit for a storm water discharge from construction activities that disturb less than five acres where:

(A) The value of the rainfall erosivity factor ("R" in the Revised Universal Soil Loss Equation) is less than five during the period of construction activity. The rainfall erosivity factor is determined in accordance with Chapter 2 of *Agriculture Handbook Number 703, Predicting Soil Erosion by Water: A Guide to Conservation Planning With the Revised Universal Soil Loss Equation (RUSLE)*, pages 21-64, dated January 1997. The Director of the Federal Register approves this incorporation by reference in accordance with 5 U.S.C 552(a) and 1 CFR part 51. Copies may be obtained from EPA's Water Resource Center, Mail Code RC4100, 401 M St. S.W., Washington, DC 20460. A copy is also available for inspection at the U.S. EPA Water Docket , 401 M Street S.W., Washington, DC. 20460, or the Office of the Federal Register, 800 N. Capitol Street N.W. Suite 700, Washington, DC. An operator must certify to the Director that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five; or

(B) Storm water controls are not needed based on a "total maximum daily load" (TMDL) approved or established by EPA that addresses the pollutant(s) of concern or, for non-impaired waters that do not require TMDLs, an equivalent analysis that determines allocations for small construction sites for the pollutant(s) of concern or that determines that such allocations are not needed to protect water quality based on consideration of existing in-stream concentrations, expected growth in pollutant contributions from all sources, and a margin of safety. For the purpose of this paragraph, the pollutant(s) of concern include sediment or a parameter that addresses sediment (such as total suspended solids, turbidity or siltation) and any other pollutant that has been identified as a cause of impairment of any water body that will receive a discharge from the construction activity.

The operator must certify to the Director that the construction activity will take place, and storm water discharges will occur, within the drainage area addressed by the TMDL or equivalent analysis.

(ii) Any other construction activity designated by the Director, or in States with approved NPDES programs either the Director or the EPA Regional Administrator, based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants to waters of the United States.

EXHIBIT 1 TO § 122.26(B)(15).—SUMMARY OF COVERAGE OF "STORM WATER DISCHARGES ASSOCIATED WITH SMALL CONSTRUCTION ACTIVITY" UNDER THE NPDES STORM WATER PROGRAM

Automatic Designation: Required Nationwide Coverage.	• Construction activities that result in a land disturbance of equal to or greater than one acre and less than five acres. • Construction activities disturbing less than one acre if part of a larger common plan of development or sale with a planned disturbance of equal to or greater than one acre and less than five acres. (see § 122.26(b)(15)(i).)
Potential Designation: Optional Evaluation and Designation by the NPDES Permitting Authority or EPA Regional Administrator.	• Construction activities that result in a land disturbance of less than one acre based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants. (see § 122.26(b)(15)(ii).)
Potential Waiver: Waiver from Requirements as Determined by the NPDES Permitting Authority..	Any automatically designated construction activity where the operator certifies: (1) A rainfall erosivity factor of less than five, or (2) That the activity will occur within an area where controls are not needed based on a TMDL or, for non-impaired waters that do not require a TMDL, an equivalent analysis for the pollutant(s) of concern. (see § 122.26(b)(15)(i).)

(16) *Small municipal separate storm sewer system* means all separate storm sewers that are:

(i) Owned or operated by the United States, a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States.

(ii) Not defined as "large" or "medium" municipal separate storm sewer systems pursuant to paragraphs (b)(4) and (b)(7) of this section, or designated under paragraph (a)(1)(v) of this section.

(iii) This term includes systems similar to separate storm sewer systems in municipalities, such as systems at military bases, large hospital or prison complexes, and highways and other thoroughfares. The term does not include separate storm sewers in very discrete areas, such as individual buildings.

(17) *Small MS4* means a small municipal separate storm sewer system.

(18) *Municipal separate storm sewer system* means all separate storm sewers that are defined as "large" or "medium" or "small" municipal separate storm sewer systems pursuant to paragraphs (b)(4), (b)(7), and (b)(16) of this section, or designated under paragraph (a)(1)(v) of this section.

(19) *MS4* means a municipal separate storm sewer system.

(20) *Uncontrolled sanitary landfill* means a landill or open dump, whether in operation or closed, that does not meet the requirements for runon or runoff controls established pursuant to subtitle D of the Solid Waste Disposal Act.

(c) *Application requirements for storm water discharges associated with industrial activity and storm water discharges associated with small construction activity*—(1) *Individual application.* Dischargers of storm water associated with industrial activity and with small

construction activity are required to apply for an individual permit or seek coverage under a promulgated storm water general permit. Facilities that are required to obtain an individual permit, or any discharge of storm water which the Director is evaluating for designation (*see* 40 CFR 124.52(c)) under paragraph (a)(1)(v) of this section and is not a municipal separate storm sewer, and which is not part of a group application described under paragraph (c)(2) of this section, shall submit an NPDES application in accordance with the requirements of §122.21 as modified and supplemented by the provisions of the remainder of this paragraph. Applicants for discharges composed entirely of storm water shall submit Form 1 and Form 2F. Applicants for discharges composed of storm water and non-storm water shall submit Form 1, Form 2C, and Form 2F. Applicants for new sources or new discharges (as defined in §122.2 of this part) composed of storm water and non-storm water shall submit Form 1, Form 2D, and Form 2F.

(i) Except as provided in §122.26(c)(1)(ii)-(iv), the operator of a storm water discharge associated with industrial activity subject to this section shall provide:

(A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) of the facility including: each of its drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each past or present area used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility;

(B) An estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall (within a mile radius of the facility) and a narrative description of the following: Significant materials that in the three years prior to the submittal of this application have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of such materials; materials management practices employed, in the three years prior to the submittal of this application, to minimize contact by these materials with storm water runoff; materials loading and access areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; the location and a description of existing structural and non-structural control measures to reduce pollutants in storm water runoff; and a description of the treatment the storm water receives, including the ultimate disposal of any solid or fluid wastes other than by discharge;

(C) A certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by a NPDES permit; tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. The certification shall include a description of the method used, the date of any testing, and the on-site drainage points that were directly observed during a test;

(D) Existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility that have taken place within the three years prior to the submittal of this application;

(E) Quantitative data based on samples collected during storm events and collected in accordance with §122.21 of this part from all outfalls containing a storm water discharge associated with industrial activity for the following parameters:

(1) Any pollutant limited in an effluent guideline to which the facility is subject;

(2) Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit);

(3) Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;

(4) Any information on the discharge required under paragraph §122.21(g)(7)(iii) and (iv) of this part;

(5) Flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, and the method of flow measurement or estimation; and

(6) The date and duration (in hours) of the storm event(s) sampled, rainfall measurements or estimates of the storm event (in inches) which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event (in hours);

(F) Operators of a discharge which is composed entirely of storm water are exempt from the requirements of §122.21 (g)(2), (g)(3), (g)(4), (g)(5), (g)(7)(iii), (g)(7)(iv), (g)(7)(v), and (g)(7)(viii); and

(G) Operators of new sources or new discharges (as defined in §122.2 of this part) which are composed in part or entirely of storm water must include estimates for the pollutants or parameters listed in paragraph (c)(1)(i)(E) of this section instead of actual sampling data, along with the source of each estimate. Operators of new sources or new discharges composed in part or entirely of storm water must provide quantitative data for the parameters listed in paragraph (c)(1)(i)(E) of this section within two years after commencement of discharge, unless such data has already been reported under the monitoring requirements of the NPDES permit for the discharge. Operators of a new source or new discharge which is composed entirely of storm water are exempt from the requirements of §122.21 (k)(3)(ii), (k)(3)(iii), and (k)(5).

(ii) An operator of an existing or new storm water discharge that is associated with industrial activity solely under paragraph (b)(14)(x) of this section or is associated with small construction activity solely under paragraph (b)(15) of this section, is exempt from the requirements of §122.21(g) and paragraph (c)(1)(i) of this section. Such operator shall provide a narrative description of:

(A) The location (including a map) and the nature of the construction activity;

(B) The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;

(C) Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a brief description of applicable State and local erosion and sediment control requirements;

(D) Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a brief description of applicable State or local erosion and sediment control requirements;

(E) An estimate of the runoff coefficient of the site and the increase in impervious area after the construction addressed in the permit application is completed, the nature of fill material and existing data describing the soil or the quality of the discharge; and

(F) The name of the receiving water.

(iii) The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless the facility:

(A) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 117.21 or 40 CFR 302.6 at anytime since November 16, 1987; or

(B) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 110.6 at any time since November 16, 1987; or

(C) Contributes to a violation of a water quality standard.

(iv) The operator of an existing or new discharge composed entirely of storm water from a mining operation is not required to submit a permit application unless the discharge has come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(v) Applicants shall provide such other information the Director may reasonably require under § 122.21(g)(13) of this part to determine whether to issue a permit and may require any facility subject to paragraph (c)(1)(ii) of this section to comply with paragraph (c)(1)(i) of this section.

(2) *Group application for discharges associated with industrial activity.* In lieu of individual applications or notice of intent to be covered by a general permit for storm water discharges associated with industrial activity, a group application may be filed by an entity representing a group of applicants (except facilities that have existing individual NPDES permits for storm water) that are part of the same subcategory (*see* 40 CFR subchapter N, part 405 to 471) or, where such grouping is inapplicable, are sufficiently similar as to be appropriate for general permit coverage under § 122.28 of this part. The part 1 application shall be submitted to the Office of Water Enforcement and Permits, U.S. EPA, 401 M Street, SW., Washington, DC 20460 (EN-336) for approval. Once a part 1 application is approved, group applicants are to submit Part 2 of the group application to the Office of Water Enforcement and Permits. A group application shall consist of:

(i) *Part 1.* Part 1 of a group application shall:

(A) Identify the participants in the group application by name and location. Facilities participating in the group application shall be listed in nine subdivisions, based on the facility location relative to the nine precipitation zones indicated in appendix E to this part.

(B) Include a narrative description summarizing the industrial activities of participants of the group application and explaining why the participants, as a whole, are sufficiently similar to be a covered by a general permit;

(C) Include a list of significant materials stored exposed to precipitation by participants in the group application and materials management practices employed to diminish contact by these materials with precipitation and storm water runoff;

(D) For groups of more than 1,000 members, identify at least 100 dischargers participating in the group application from which quantitative data will be submitted. For groups of 100 or more members, identify a minimum of ten percent of the dischargers participating in the group application from which quantitative data will be submitted. For groups of between 21 and 99 members identify a minimum of ten dischargers participating in the group application from which quantitative data will be submitted. For groups of 4 to 20 members, identify a minimum of 50 percent of the dischargers participating in the group application from which quantitative data will be submitted. For groups with more than 10 members, either a minimum of two dischargers from each precipitation zone indicated in appendix E of this part in which ten or more members of the group are located, or one discharger from each precipitation zone indicated in appendix E of this part in which nine or fewer members of the group are located, must be identified to submit quantitative data. For groups of 4 to 10 members, at least one facility in each precipitation zone indicated in appendix E of this part in which members of the group are located must be identifed to submit quantitative data. A description of why the facilities selected to perform sampling and analysis are representative of the group as a whole in terms of the information provided in paragraphs (c)(1)(i)(B) and (c)(1)(i)(C) of this section, shall accompany this section. Different factors impacting the nature of the storm water discharges, such as the processes used and material management, shall be represented, to the extent feasible, in a manner roughly equivalent to their proportion in the group.

(ii) *Part 2.* Part 2 of a group application shall contain quantitative data

(NPDES Form 2F), as modified by paragraph (c)(1) of this section, so that when part 1 and part 2 of the group application are taken together, a complete NPDES application (Form 1, Form 2C, and Form 2F) can be evaluated for each discharger identified in paragraph (c)(2)(i)(D) of this section.

(d) *Application requirements for large and medium municipal separate storm sewer discharges.* The operator of a discharge from a large or medium municipal separate storm sewer or a municipal separate storm sewer that is designated by the Director under paragraph (a)(1)(v) of this section, may submit a jurisdiction-wide or system-wide permit application. Where more than one public entity owns or operates a municipal separate storm sewer within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application. Permit applications for discharges from large and medium municipal storm sewers or municipal storm sewers designated under paragraph (a)(1)(v) of this section shall include:

(1) *Part 1.* Part 1 of the application shall consist of:

(i) *General information.* The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

(ii) *Legal authority.* A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(i) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

(iii) *Source identification.* (A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

(B) A USGS 7.5 minute topographic map (or equivalent topographic map with a scale between 1:10,000 and 1:24,000 if cost effective) extending one mile beyond the service boundaries of the municipal storm sewer system covered by the permit application. The following information shall be provided:

(*1*) The location of known municipal storm sewer system outfalls discharging to waters of the United States;

(*2*) A description of the land use activities (e.g. divisions indicating undeveloped, residential, commercial, agricultural and industrial uses) accompanied with estimates of population densities and projected growth for a ten year period within the drainage area served by the separate storm sewer. For each land use type, an estimate of an average runoff coefficient shall be provided;

(*3*) The location and a description of the activities of the facility of each currently operating or closed municipal landfill or other treatment, storage or disposal facility for municipal waste;

(*4*) The location and the permit number of any known discharge to the municipal storm sewer that has been issued a NPDES permit;

(*5*) The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc.); and

(*6*) The identification of publicly owned parks, recreational areas, and other open lands.

(iv) *Discharge characterization.* (A) Monthly mean rain and snow fall estimates (or summary of weather bureau data) and the monthly average number of storm events.

(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer, including a description of the outfalls sampled, sampling procedures and analytical methods used.

(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts. At a minimum, the description of impacts shall include a description of

whether the water bodies receiving such discharges have been:

(1) Assessed and reported in section 305(b) reports submitted by the State, the basis for the assessment (evaluated or monitored), a summary of designated use support and attainment of Clean Water Act (CWA) goals (fishable and swimmable waters), and causes of nonsupport of designated uses;

(2) Listed under section 304(l)(1)(A)(i), section 304(l)(1)(A)(ii), or section 304(l)(1)(B) of the CWA that is not expected to meet water quality standards or water quality goals;

(3) Listed in State Nonpoint Source Assessments required by section 319(a) of the CWA that, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain water quality standards due to storm sewers, construction, highway maintenance and runoff from municipal landfills and municipal sludge adding significant pollution (or contributing to a violation of water quality standards);

(4) Identified and classified according to eutrophic condition of publicly owned lakes listed in State reports required under section 314(a) of the CWA (include the following: A description of those publicly owned lakes for which uses are known to be impaired; a description of procedures, processes and methods to control the discharge of pollutants from municipal separate storm sewers into such lakes; and a description of methods and procedures to restore the quality of such lakes);

(5) Areas of concern of the Great Lakes identified by the International Joint Commission;

(6) Designated estuaries under the National Estuary Program under section 320 of the CWA;

(7) Recognized by the applicant as highly valued or sensitive waters;

(8) Defined by the State or U.S. Fish and Wildlife Services's National Wetlands Inventory as wetlands; and

(9) Found to have pollutants in bottom sediments, fish tissue or biosurvey data.

(D) *Field screening.* Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application. At a minimum, a screening analysis shall include a narrative description, for either each field screening point or major outfall, of visual observations made during dry weather periods. If any flow is observed, two grab samples shall be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a narrative description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observations regarding the potential presence of non-storm water discharges or illegal dumping shall be provided. In addition, a narrative description of the results of a field analysis using suitable methods to estimate pH, total chlorine, total copper, total phenol, and detergents (or surfactants) shall be provided along with a description of the flow rate. Where the field analysis does not involve analytical methods approved under 40 CFR part 136, the applicant shall provide a description of the method used including the name of the manufacturer of the test method along with the range and accuracy of the test. Field screening points shall be either major outfalls or other outfall points (or any other point of access such as manholes) randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a segment of the storm sewer system or major outfall. The field screening points shall be established using the following guidelines and criteria:

(1) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart shall be overlayed on a map of the municipal storm sewer system, creating a series of cells;

(2) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(3) Field screening points should be located downstream of any sources of suspected illegal or illicit activity;

(4) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system,

within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(5) Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; and land use types;

(6) For medium municipal separate storm sewer systems, no more than 250 cells need to have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible); and

(7) Large or medium municipal separate storm sewer systems which are unable to utilize the procedures described in paragraphs (d)(1)(iv)(D) (1) through (6) of this section, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen no more than 500 or 250 major outfalls respectively (or all major outfalls in the system, if less); in such circumstances, the applicant shall establish a grid system consisting of north-south and east-west lines spaced ¼ mile apart as an overlay to the boundaries of the municipal storm sewer system, thereby creating a series of cells; the applicant will then select major outfalls in as many cells as possible until at least 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

(E) *Characterization plan.* Information and a proposed program to meet the requirements of paragraph (d)(2)(iii) of this section. Such description shall include: the location of outfalls or field screening points appropriate for representative data collection under paragraph (d)(2)(iii)(A) of this section, a description of why the outfall or field screening point is representative, the seasons during which sampling is intended, a description of the sampling equipment. The proposed location of outfalls or field screening points for such sampling should reflect water quality concerns (*see* paragraph (d)(1)(iv)(C) of this section) to the extent practicable.

(v) *Management programs.* (A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

(vi) *Fiscal resources.* (A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality's budget for existing storm water programs, including an overview of the municipality's financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

(2) *Part 2.* Part 2 of the application shall consist of:

(i) *Adequate legal authority.* A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

(ii) *Source identification.* The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(*1*) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

(iii) *Characterization data.* When "quantitative data" for a pollutant are required under paragraph (d)(a)(iii)(A)(*3*) of this section, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under part 136 of this chapter. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(A) Quantitative data from representative outfalls designated by the Director (based on information received in part 1 of the application, the Director shall designate between five and ten outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system or, where there are less than five outfalls covered in the application, the Director shall designate all outfalls) developed as follows:

(*1*) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at §122.21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions);

(*2*) A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(*3*) For samples collected and described under paragraphs (d)(2)(iii)(A)(*1*) and (A)(*2*) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II; the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants:

Total suspended solids (TSS)
Total dissolved solids (TDS)
COD
BOD_5
Oil and grease
Fecal coliform
Fecal streptococcus
pH
Total Kjeldahl nitrogen
Nitrate plus nitrite
Dissolved phosphorus
Total ammonia plus organic nitrogen
Total phosphorus

(*4*) Additional limited quantitative data required by the Director for determining permit conditions (the Director

may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under §122.21(c)(7)) for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(*1*) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section; and

(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

(iv) *Proposed management program.* A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls. Such programs shall be based on:

(A) A description of ~~structural~~ and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

(*1*) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

(*2*) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed. (Controls to reduce pollutants in discharges from municipal separate storm sewers containing construction site runoff are addressed in paragraph (d)(2)(iv)(D) of this section;

(*3*) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

(5) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section); and

(6) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

(B) A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include:

(1) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water (program descriptions shall address discharges or flows from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States);

(2) A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens;

(3) A description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include: sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium; testing with fluorometric dyes; or conducting in storm sewer inspections where safety and other considerations allow. Such description shall include the location of storm sewers that have been identified for such evaluation);

(4) A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer;

(5) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

(6) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

(7) A description of controls to limit infiltration of seepage from municipal

sanitary sewers to municipal separate storm sewer systems where necessary:

(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

(*1*) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

(*2*) Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under §122.21(g)(7)(vi) and (vii).

(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:

(*1*) A description of procedures for site planning which incorporate consideration of potential water quality impacts;

(*2*) A description of requirements for nonstructural and structural best management practices;

(*3*) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and

(*4*) A description of appropriate educational and training measures for construction site operators.

(v) *Assessment of controls.* Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

(vi) *Fiscal analysis.* For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2)(iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

(viii) Where requirements under paragraph (d)(1)(iv)(E), (d)(2)(ii), (d)(2)(iii)(B) and (d)(2)(iv) of this section are not practicable or are not applicable, the Director may exclude any operator of a discharge from a municipal separate storm sewer which is designated under paragraph (a)(1)(v), (b)(4)(ii) or (b)(7)(ii) of this section from such requirements. The Director shall not exclude the operator of a discharge from a municipal separate storm sewer identified in appendix F, G, H or I of part 122, from any of the permit application requirements under this paragraph except where authorized under this section.

(e) *Application deadlines.* Any operator of a point source required to obtain a permit under this section that does not have an effective NPDES permit authorizing discharges from its storm water outfalls shall submit an application in accordance with the following deadlines:

(1) *Storm water discharges associated with industrial activity.* (i) Except as provided in paragraph (e)(1)(ii) of this

section, for any storm water discharge associated with industrial activity identified in paragraphs (b)(14)(i) through (xi) of this section, that is not part of a group application as described in paragraph (c)(2) of this section or that is not authorized by a storm water general permit, a permit application made pursuant to paragraph (c) of this section must be submitted to the Director by October 1, 1992:

(ii) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 that is not authorized by a general or individual permit, other than an airport, powerplant, or uncontrolled sanitary landfill, the permit application must be submitted to the Director by March 10, 2003.

(2) For any group application submitted in accordance with paragraph (c)(2) of this section:

(i) *Part 1.* (A) Except as provided in paragraph (e)(2)(i)(B) of this section, part 1 of the application shall be submitted to the Director, Office of Wastewater Enforcement and Compliance by September 30, 1991;

(B) Any municipality with a population of less than 250,000 shall not be required to submit a part 1 application before May 18, 1992.

(C) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 other than an airport, powerplant, or uncontrolled sanitary landfill, permit applications requirements are reserved.

(ii) Based on information in the part 1 application, the Director will approve or deny the members in the group application within 60 days after receiving part 1 of the group application.

(iii) *Part 2.* (A) Except as provided in paragraph (e)(2)(iii)(B) of this section, part 2 of the application shall be submittted to the Director, Office of Wastewater Enforcement and Compliance by October 1, 1992;

(B) Any municipality with a population of less than 250,000 shall not be required to submit a part 1 application before May 17, 1993.

(C) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 other than an airport, powerplant, or uncontrolled sanitary landfill, permit applications requirements are reserved.

(iv) *Rejected facilities.* (A) Except as provided in paragraph (e)(2)(iv)(B) of this section, facilities that are rejected as members of the group shall submit an individual application (or obtain coverage under an applicable general permit) no later than 12 months after the date of receipt of the notice of rejection or October 1, 1992, whichever comes first.

(B) Facilities that are owned or operated by a municipality and that are rejected as members of part 1 group application shall submit an individual application no later than 180 days after the date of receipt of the notice of rejection or October 1, 1992, whichever is later.

(v) A facility listed under paragraph (b)(14) (i)-(xi) of this section may add on to a group application submitted in accordance with paragraph (e)(2)(i) of this section at the discretion of the Office of Water Enforcement and Permits, and only upon a showing of good cause by the facility and the group applicant; the request for the addition of the facility shall be made no later than February 18, 1992; the addition of the facility shall not cause the percentage of the facilities that are required to submit quantitative data to be less than 10%, unless there are over 100 facilities in the group that are submitting quantitative data; approval to become part of group application must be obtained from the group or the trade association representing the individual facilities.

(3) For any discharge from a large municipal separate storm sewer system;

(i) Part 1 of the application shall be submitted to the Director by November 18, 1991;

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application;

(iii) Part 2 of the application shall be submitted to the Director by November 16, 1992.

(4) For any discharge from a medium municipal separate storm sewer system:

(i) Part 1 of the application shall be submitted to the Director by May 18, 1992.

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application.

(iii) Part 2 of the application shall be submitted to the Director by May 17, 1993.

(5) A permit application shall be submitted to the Director within 180 days of notice, unless permission for a later date is granted by the Director (see §124.52(c) of this chapter), for:

(i) A storm water discharge that the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines that the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (see paragraphs (a)(1)(v) and (b)(15)(ii) of this section);

(ii) A storm water discharge subject to paragraph (c)(1)(v) of this section.

(6) Facilities with existing NPDES permits for storm water discharges associated with industrial activity shall maintain existing permits. Facilities with permits for storm water discharges associated with industrial activity which expire on or after May 18, 1992 shall submit a new application in accordance with the requirements of 40 CFR 122.21 and 40 CFR 122.26(c) (Form 1, Form 2F, and other applicable Forms) 180 days before the expiration of such permits.

(7) The Director shall issue or deny permits for discharges composed entirely of storm water under this section in accordance with the following schedule:

(i)(A) Except as provided in paragraph (e)(7)(i)(B) of this section, the Director shall issue or deny permits for storm water discharges associated with industrial activity no later than October 1, 1993, or, for new sources or existing sources which fail to submit a complete permit application by October 1, 1992, one year after receipt of a complete permit application;

(B) For any municipality with a population of less than 250,000 which submits a timely Part 1 group application under paragraph (e)(2)(i)(B) of this section, the Director shall issue or deny permits for storm water discharges associated with industrial activity no later than May 17, 1994, or, for any such municipality which fails to submit a complete Part II group permit application by May 17, 1993, one year after receipt of a complete permit application;

(ii) The Director shall issue or deny permits for large municipal separate storm sewer systems no later than November 16, 1993, or, for new sources or existing sources which fail to submit a complete permit application by November 16, 1992, one year after receipt of a complete permit application;

(iii) The Director shall issue or deny permits for medium municipal separate storm sewer systems no later than May 17, 1994, or, for new sources or existing sources which fail to submit a complete permit application by May 17, 1993, one year after receipt of a complete permit application.

(8) For any storm water discharge associated with small construction activity identified in paragraph (b)(15)(i) of this section, see §122.21(c)(1). Discharges from these sources require permit authorization by March 10, 2003, unless designated for coverage before then.

(9) For any discharge from a regulated small MS4, the permit application made under §122.33 must be submitted to the Director by:

(i) March 10, 2003 if designated under §122.32(a)(1) unless your MS4 serves a jurisdiction with a population under 10,000 and the NPDES permitting authority has established a phasing schedule under §123.35(d)(3) (see §122.33(c)(1)); or

(ii) Within 180 days of notice, unless the NPDES permitting authority grants a later date, if designated under §122.32(a)(2) (see §122.33(c)(2)).

(f) *Petitions.* (1) Any operator of a municipal separate storm sewer system may petition the Director to require a separate NPDES permit (or a permit

issued under an approved NPDES State program) for any discharge into the municipal separate storm sewer system.

(2) Any person may petition the Director to require a NPDES permit for a discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) The owner or operator of a municipal separate storm sewer system may petition the Director to reduce the Census estimates of the population served by such separate system to account for storm water discharged to combined sewers as defined by 40 CFR 35.2005(b)(11) that is treated in a publicly owned treatment works. In municipalities in which combined sewers are operated, the Census estimates of population may be reduced proportional to the fraction, based on estimated lengths, of the length of combined sewers over the sum of the length of combined sewers and municipal separate storm sewers where an applicant has submitted the NPDES permit number associated with each discharge point and a map indicating areas served by combined sewers and the location of any combined sewer overflow discharge point.

(4) Any person may petition the Director for the designation of a large, medium, or small municipal separate storm sewer system as defined by paragraph (b)(4)(iv), (b)(7)(iv), or (b)(16) of this section.

(5) The Director shall make a final determination on any petition received under this section within 90 days after receiving the petition with the exception of petitions to designate a small MS4 in which case the Director shall make a final determination on the petition within 180 days after its receipt.

(g) *Conditional exclusion for "no exposure" of industrial activities and materials to storm water.* Discharges composed entirely of storm water are not storm water discharges associated with industrial activity if there is "no exposure" of industrial materials and activities to rain, snow, snowmelt and/or runoff, and the discharger satisfies the conditions in paragraphs (g)(1) through (g)(4) of this section. "No exposure" means that all industrial materials and activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product or waste product.

(1) *Qualification.* To qualify for this exclusion, the operator of the discharge must:

(i) Provide a storm resistant shelter to protect industrial materials and activities from exposure to rain, snow, snow melt, and runoff;

(ii) Complete and sign (according to § 122.22) a certification that there are no discharges of storm water contaminated by exposure to industrial materials and activities from the entire facility, except as provided in paragraph (g)(2) of this section;

(iii) Submit the signed certification to the NPDES permitting authority once every five years;

(iv) Allow the Director to inspect the facility to determine compliance with the "no exposure" conditions;

(v) Allow the Director to make any "no exposure" inspection reports available to the public upon request; and

(vi) For facilities that discharge through an MS4, upon request, submit a copy of the certification of "no exposure" to the MS4 operator, as well as allow inspection and public reporting by the MS4 operator.

(2) *Industrial materials and activities not requiring storm resistant shelter.* To qualify for this exclusion, storm resistant shelter is not required for:

(i) Drums, barrels, tanks, and similar containers that are tightly sealed, provided those containers are not deteriorated and do not leak ("Sealed" means banded or otherwise secured and without operational taps or valves);

(ii) Adequately maintained vehicles used in material handling; and

(iii) Final products, other than products that would be mobilized in storm water discharge (e.g., rock salt).

(3) *Limitations.* (i) Storm water discharges from construction activities identified in paragraphs (b)(14)(x) and (b)(15) are not eligible for this conditional exclusion.

(ii) This conditional exclusion from the requirement for an NPDES permit is available on a facility-wide basis only, not for individual outfalls. If a facility has some discharges of storm water that would otherwise be "no exposure" discharges, individual permit requirements should be adjusted accordingly.

(iii) If circumstances change and industrial materials or activities become exposed to rain, snow, snow melt, and/or runoff, the conditions for this exclusion no longer apply. In such cases, the discharge becomes subject to enforcement for un-permitted discharge. Any conditionally exempt discharger who anticipates changes in circumstances should apply for and obtain permit authorization prior to the change of circumstances.

(iv) Notwithstanding the provisions of this paragraph, the NPDES permitting authority retains the authority to require permit authorization (and deny this exclusion) upon making a determination that the discharge causes, has a reasonable potential to cause, or contributes to an instream excursion above an applicable water quality standard, including designated uses.

(4) *Certification.* The no exposure certification must require the submission of the following information, at a minimum, to aid the NPDES permitting authority in determining if the facility qualifies for the no exposure exclusion:

(i) The legal name, address and phone number of the discharger (see §122.21(b));

(ii) The facility name and address, the county name and the latitude and longitude where the facility is located;

(iii) The certification must indicate that none of the following materials or activities are, or will be in the foreseeable future, exposed to precipitation:

(A) Using, storing or cleaning industrial machinery or equipment, and areas where residuals from using, storing or cleaning industrial machinery or equipment remain and are exposed to storm water;

(B) Materials or residuals on the ground or in storm water inlets from spills/leaks;

(C) Materials or products from past industrial activity;

(D) Material handling equipment (except adequately maintained vehicles);

(E) Materials or products during loading/unloading or transporting activities;

(F) Materials or products stored outdoors (except final products intended for outside use, e.g., new cars, where exposure to storm water does not result in the discharge of pollutants);

(G) Materials contained in open, deteriorated or leaking storage drums, barrels, tanks, and similar containers;

(H) Materials or products handled/stored on roads or railways owned or maintained by the discharger;

(I) Waste material (except waste in covered, non-leaking containers, e.g., dumpsters);

(J) Application or disposal of process wastewater (unless otherwise permitted); and

(K) Particulate matter or visible deposits of residuals from roof stacks/vents not otherwise regulated, i.e., under an air quality control permit, and evident in the storm water outflow;

(iv) All "no exposure" certifications must include the following certification statement, and be signed in accordance with the signatory requirements of §122.22: "I certify under penalty of law that I have read and understand the eligibility requirements for claiming a condition of "no exposure" and obtaining an exclusion from NPDES storm water permitting; and that there are no discharges of storm water contaminated by exposure to industrial activities or materials from the industrial facility identified in this document (except as allowed under paragraph (g)(2)) of this section. I understand that I am obligated to submit a no exposure certification form once every five years to the NPDES permitting authority and, if requested, to the operator of the local MS4 into which this facility discharges (where applicable). I understand that I must allow the NPDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections

80

to confirm the condition of no exposure and to make such inspection reports publicly available upon request. I understand that I must obtain coverage under an NPDES permit prior to any point source discharge of storm water from the facility. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based upon my inquiry of the person or persons who manage the system, or those persons directly involved in gathering the information, the information submitted is to the best of my knowledge and belief true, accurate and complete. I am aware there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

[55 FR 48063, Nov. 16, 1990, as amended at 56 FR 12100, Mar. 21, 1991; 56 FR 56554, Nov. 5, 1991; 57 FR 11412, Apr. 2, 1992; 57 FR 60447, Dec. 18, 1992; 60 FR 17956, Apr. 7, 1995; 60 FR 19464, Apr. 18, 1995; 60 FR 40235, Aug. 7, 1995; 64 FR 68838, Dec. 8, 1999; 65 FR 30907, May 15, 2000]

§ 122.27 Silvicultural activities (applicable to State NPDES programs, see § 123.25).

(a) *Permit requirement.* Silvicultural point sources, as defined in this section, as point sources subject to the NPDES permit program.

(b) *Definitions.* (1) *Silvicultural point source* means any discernible, confined and discrete conveyance related to rock crushing, gravel washing, log sorting, or log storage facilities which are operated in connection with silvicultural activities and from which pollutants are discharged into waters of the United States. The term does not include non-point source silvicultural activities such as nursery operations, site preparation, reforestation and subsequent cultural treatment, thinning, prescribed burning, pest and fire control, harvesting operations, surface drainage, or road construction and maintenance from which there is natural runoff. However, some of these activities (such as stream crossing for roads) may involve point source discharges of dredged or fill material which may require a CWA section 404 permit (See 33 CFR 209.120 and part 233).

(2) *Rock crushing and gravel washing facilities* means facilities which process crushed and broken stone, gravel, and riprap (See 40 CFR part 436, subpart B, including the effluent limitations guidelines).

(3) *Log sorting and log storage facilities* means facilities whose discharges result from the holding of unprocessed wood, for example, logs or roundwood with bark or after removal of bark held in self-contained bodies of water (mill ponds or log ponds) or stored on land where water is applied intentionally on the logs (wet decking). (See 40 CFR part 429, subpart I, including the effluent limitations guidelines).

§ 122.28 General permits (applicable to State NPDES programs, see § 123.25).

(a) *Coverage.* The Director may issue a general permit in accordance with the following:

(1) *Area.* The general permit shall be written to cover one or more categories or subcategories of discharges or sludge use or disposal practices or facilities described in the permit under paragraph (a)(2)(ii) of this section, except those covered by individual permits, within a geographic area. The area should correspond to existing geographic or political boundaries such as:

(i) Designated planning areas under sections 208 and 303 of CWA;

(ii) Sewer districts or sewer authorities;

(iii) City, county, or State political boundaries;

(iv) State highway systems;

(v) Standard metropolitan statistical areas as defined by the Office of Management and Budget;

(vi) Urbanized areas as designated by the Bureau of the Census according to criteria in 30 FR 15202 (May 1, 1974); or

(vii) Any other appropriate division or combination of boundaries.

(2) *Sources.* The general permit may be written to regulate one or more categories or subcategories of discharges or sludge use or disposal practices or facilities, within the area described in paragraph (a)(1) of this section, where

Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges From Municipal Separate Storm Sewer Systems

3.0 ADEQUATE LEGAL AUTHORITY

3.1 BACKGROUND

A crucial requirement of the NPDES storm water regulation is that a municipality must demonstrate that it has adequate legal authority to control the contribution of pollutants in storm water discharged to its MS4. This guidance manual and the storm water program emphasize development and implementation of storm water management programs as described in Chapter 6. In order to have an effective municipal storm water management program, a municipality must have adequate legal authority to control the contribution of pollutants discharged to the MS4.

Part 1 of the permit application requires applicants to describe their existing legal authority to control the discharge of pollutants from MS4s and evaluate the adequacy of these ordinances. Where existing ordinances were lacking, a proposed schedule to obtain the necessary authority was included with the Part 1 application. In Part 2 of the application, municipal applicants must demonstrate that they now possess adequate legal authority to:

- Control construction site and other industrial discharges to the MS4;
- Prohibit illicit discharges and control spills and dumping;
- Control potential sources of pollutants from discharges to or from coapplicants' MS4s, or MS4s that are interconnected or shared with other entities;
- Require compliance with all regulations and statutes; and
- Carry out inspection, surveillance, and monitoring procedures.

Section 3.2 reviews each of these regulatory requirements. Section 3.3 describes specific procedures a municipality may use to demonstrate adequate legal authority.

3.2 SUMMARY OF REGULATORY REQUIREMENTS

3.2.1 Control Construction Site and Other Industrial Discharges to the MS4.

> §122.26(d)(2)(i)(A). [The applicant must demonstrate that it can control] through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity.

The municipality, as a permittee, is responsible for compliance with its permit and must have the authority to implement the conditions in its permit. To comply with its permit, a municipality must have the authority to hold dischargers accountable for their contributions to separate storm sewers.

"Control," in this context, means not only to require disclosure of information, but also to limit, discourage, or terminate a storm water discharge to the MS4. For example, construction sites (of 5 or more acres) and other industrial activities that discharge storm water through MS4s are required to obtain individual NPDES permits or coverage under general NPDES permits from EPA or an authorized NPDES State. These permits require compliance with applicable Federal and State regulations. However, a municipality, to satisfy its permit conditions, may need to impose additional requirements on discharges

from permitted industrial facilities, as well as discharges from industrial facilities and construction sites not required to obtain permits. Therefore, a municipality should develop a mechanism to assure that all industrial facilities and constructions sites that discharge to the MS4 know their obligation to comply with the applicable terms of the municipality's storm water ordinances.

3.2.2 Prohibit Illicit Discharges and Control Spills and Dumping

> §122.26(d)(2)(i)(B). [The applicant must demonstrate that it can prohibit] through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer.
>
> §122.26(d)(2)(i)(C) [The applicant must demonstrate that it can control] through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water.

To demonstrate that it possesses adequate legal authority to control storm water discharges, a municipality must be able to effectively prohibit illicit discharges and illegal dumping. An illicit discharge is "any discharge that is not composed entirely of storm water except discharges pursuant to a NPDES permit . . . and discharges resulting from fire fighting activities" [40 CFR 122.26(b)(2)].

3.2.3 Control Contributions of Coapplicants

> §122.26(d)(2)(i)(D). [The applicant must demonstrate that it can control] through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system.

An operator of a MS4 may participate in an application with one or more other operators, or may submit an individual application for the separate storm sewer it operates. As indicated in the box above, the operator of a discharge from a large or medium MS4 may submit, through the use of interjurisdictional agreements, a system-wide permit application. The system-wide application can accommodate existing storm water programs, on a watershed basis, as well as programs which must take into account regional differences in climate, geography, and political institutions. Such an application should cover issues of liability, financial contributions, access to records, enforcement responsibilities, and any other applicable areas of mutual concern.

When two or more municipalities submit a joint application, each coapplicant must demonstrate that it individually possesses adequate legal authority over the entire municipal system it operates or owns. A coapplicant need not fulfill every component of legal authority specified in the regulations, as long as the combined legal authority of all coapplicants satisfies the regulatory criteria for every segment of the MS4 (including authority over all sources that discharge to the MS4).

As coapplicants, for example, a county and a flood control district within that county may together possess adequate legal authority. The flood control district may have legal authority to build, operate, and maintain structures associated with major drainage channels within the county. The county itself may have legal authority to control pollutants in discharges from privately owned lands to the MS4s and legal authority to build, operate, and maintain structures associated with minor drainage channels that tie into major drainage channels. In this situation, the combined legal authority of the coapplicants may be adequate for the system, provided that the only discharge to major drainage channels comes from the county's separate storm sewer system. As another example, a department of transportation or flood control district with no land use authority could be a co-permittee with

a city that does possess land use authority over the entire jurisdiction.

Coapplicants also may use interjurisdictional agreements to show adequate legal authority and to ensure planning, coordination, and the sharing of the resource burden of permit compliance. When more than one entity is submitting an application for a MS4 (either as coapplicants or as individual applicants for different parts of a system), the role of each party must be well defined. Each applicant or coapplicant must show the ability to fulfill its responsibilities, including legal authority for the separate storm sewers it owns or operates.

Applicants and coapplicants may use the procedures outlined in Section 3.3 to demonstrate adequate legal authority in their Part 2 permit applications. These procedures are guidelines, however, and are not intended to be the only possible approaches that applicants may follow.

3.2.4 Require Compliance with all Regulations and Statutes

To meet the requirements of §122.26(d)(2)(i)(E), the applicant must show that it has adequate authority to enforce its ordinances.

> §122.26(d)(2)(i)(E). [The applicant must demonstrate that it can require] compliance with conditions in ordinances, permits, contracts or orders.

One acceptable way to support a declaration of adequate legal authority, including the ability to enforce appropriate ordinances, is for the municipality to provide a certification from the Municipal General Counsel or equivalent. The certification should state that the applicant has the legal authority to apply and enforce the requirements of §122.26(d)(2)(i)(A)-(F) in State or local courts. The certification would, therefore, cite specific ordinances and the reasons why they are enforceable. The statement should discuss what the municipality can do to ensure full compliance with §122.26(d)(2)(i).

In a Part 2 application, through a statement from the Municipal General Counsel or through some other method, a municipality should identify the administrative and legal procedures available to mandate compliance with appropriate ordinances, and, therefore, with permit conditions. Applications should contain descriptions of how ordinances are implemented and appealed. In particular, a municipality should indicate if it can issue administrative orders and injunctions or if it must go through the court system for enforcement actions.

3.2.5 Carry Out Inspection, Surveillance, and Monitoring Procedures

In their Part 2 applications, municipalities must propose programs to control the contributions of pollutants from industrial facilities and prohibit illicit discharges. For both of these activities, municipalities must have the legal authority to carry out inspection, surveillance, and monitoring procedures necessary to determine compliance.

> §122.26(d)(2)(i)(F). [The applicant must demonstrate that it can carry] out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

To meet this requirement, municipalities may wish to consider establishing ordinances that require industrial facilities to perform inspections and report the results to the city. In many municipalities, these facilities may perform similar inspections under a pretreatment program. In their Part 2 applications, municipalities should provide

documentation of their authority to enter, sample, inspect, review, and copy records, etc., as well as demonstrate their authority to require regular reports.

3.3 PROCEDURES FOR DEMONSTRATING ADEQUATE LEGAL AUTHORITY

The Part 2 application requires the applicant or coapplicants to cite and describe specific ordinances currently in effect and demonstrate that the jurisdiction for these ordinances covers the entire area served by the MS4. In addition, the applicant may elect to discuss specific changes in ordinances passed since the submission of the Part 1 permit application to illustrate how legal authority has evolved to meet the regulatory requirements in §122.26(d)(2)(i). One method by which an applicant can partially demonstrate that it has adequate legal authority is to develop a matrix that compares, in a side-by-side format, the regulatory requirements in §122.26(d)(2)(i)(A)-(F) and the municipality's legal authority. Once completed, the matrix would indicate whether an adequate legal framework exists to address all key regulatory requirements identified in §122.26(d)(2)(i)(A)-(F). Furthermore, the matrix could also illustrate where the authority to mandate compliance is vested.

In order to support an assertion of adequate legal authority, applicants should include the complete text of the applicable portions of the ordinances or other such provisions in the application. The applicant should also provide a specific explanation of why and how the language of a particular ordinance or other authority meets Federal regulatory requirements. The application should indicate to whom the ordinance applies and how it will operate to control, prevent, or stop discharges that violate permit conditions. For example, the municipality may describe and provide an excerpt from a city ordinance that prohibits non-storm water discharges to the MS4.

Appendix C illustrates one way to detail the existence of ordinances that establish the legal authority required in §122.26(d)(2)(i). A narrative discussion of the historical use of these ordinances to control pollutants in storm water discharges also may be included. The example in Appendix C shows what the applicant may do to satisfy §122.26(d)(2)(i).

Substantial effort should be devoted to obtaining the necessary legal authority before the Part 2 application is submitted. However, some municipalities may find that the two-year application process does not allow enough time to secure adequate legal authority as described in this section. This may be due to the need for State statutory or legislative changes. In this instance, the Part 2 application must include a detailed description of what changes are needed and a schedule of when they will be accomplished. The schedule must include timetables for drafting proposed changes, public comment periods, and final authorizations.

An acceptable program must include a training program, which should be supplemented by a certification program for all construction site operators (contractors and developers), plan reviewers, and inspectors that work on sites that discharge to a MS4. For example, one NPDES State has a certification program based on adequate training and minimum-competency level testing of all private individuals involved in the preparation and implementation of erosion and sediment control plans.

6.3.3 Program to Control Pollutants in Storm Water Discharges from Waste Handling Sites and from Industrial Facilities

> §122.26(d)(2)(iv)(C). [The application must include a] description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system.

The storm water regulations envision that NPDES permitting authorities and municipaloperators will cooperate to develop programs to monitor and control pollutants in storm water discharges to municipal systems from various sites that handle waste and certain industrial facilities.

Operators responsible for storm water discharges associated with industrial activity must obtain NPDES permits from EPA or an authorized NPDES State. These industrial storm water permits will establish requirements such as controls, practices, and monitoring for storm water discharges from the industrial facilities to the MS4. The industrial storm water permits will also provide a basis for enforcement actions directly against the industrial owner or operator.

NPDES permits for MS4s will establish responsibilities for municipal system operators to control pollutants from industrial storm water discharged through their system. Proposed storm water management programs must address the reduction of pollutants in storm water discharges from municipal landfills; hazardous waste treatment, storage and disposal facilities; facilities subject to SARA Title III; and other priority industrial facilities, as determined by the applicant. Municipalities should consider the information gathered for the Part 1 application and other parts of the Part 2 application (particularly the Source Identification and Characterization Data components) when prioritizing storm water discharges from these sites. In addition, Appendix B contains a list of pollutants commonly associated with various industries.

In the Part 2 application, the Source Identification component (see Section 4 of this guidance manual) requires the applicant to provide an inventory of pollutant sources, organized by watershed. This inventory identifies and describes the products and services of each industrial facility that may discharge storm water to the MS4. The *Source Identification* component suggests applicants use standard industrial classification (SIC) codes for this description. EPA strongly recommends this information be used to identify priority waste handling sites and industrial facilities. A similar technique could be developed for sites that do not meet the regulatory definition of "storm water discharge associated with industrial activity" (i.e. not included in the *Source Identification* and *Discharge Characterization* components), but are identified as a high priority under the proposed management program. Applicants can obtain information on how SIC codes are used to describe the industrial facilities located within their jurisdictions from their NPDES permitting authority.

Characterization data should also be evaluated. Applicants should analyze quantitative data from representative outfalls to establish a monitoring and control program.

An integral part of this requirement is the adequacy of the applicant's legal authority. If a municipality believes that a discharge of storm water associated with industrial activity violates the industrial facility's NPDES permit limits, but the municipality does not have authority over the discharge, the municipality should contact the NPDES permitting authority for appropriate action. Examples of possible actions by the NPDES permitting authority are:

- For a facility that already has a NPDES individual permit, the permit may be reopened and further controls imposed;
- For a facility covered by a NPDES general permit, an individual site-specific permit application may be required; or
- For a facility not covered by a NPDES storm water permit, a permit may be required.

The municipality is ultimately responsible for discharges from their MS4. Consequently, the proposed storm water management program should describe how the municipality will help EPA and authorized NPDES States:

- Identify priority industries discharging to their systems;
- Review and evaluate storm water pollution prevention plans and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities to verify that the industries discharging storm water to the municipal systems are in compliance with their NPDES storm water permit, if required.

6.3.3.1 Identifying Priorities

Proposed management programs must clearly identify priority industrial facilities.

> §122.26(d)(2)(iv)(C)(1). [The applicant must] identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.

This section discusses how applicants might identify priority facilities. Section 6.3.3.2 discusses how municipalities might develop procedures for inspections and implementation of control measures.

At a minimum, priority facilities include:

- Operating and closed municipal landfills;
- Hazardous waste treatment, disposal or recovery facilities; and
- Facilities subject to SARA Title III.

Municipalities must identify these and other priority industrial facilities and describe the criteria used to identify them. For example, information from the Toxics Release Inventory is one source a municipality could use to identify industrial facilities subject to SARA Title III. Other sources may include CWA Section 205 or 208 use-attainability studies, other studies that indicate a site-specific beneficial use impairment immediately downstream of a storm water outfall, or records of industrial pretreatment programs or other permit programs that identify facilities that may be the source of a use impairment or

a major contribution of pollutants. The program should also describe procedures for modifying the inventory of priority industries based on additional evaluation that occurs throughout the permit term.

Applicants may initially focus their implementation efforts on known pollution sources. The municipality may have previously identified these sources, or they may be identified through existing information compiled during the permit application process. However, the initial management program implementation strategy should be based on information gathered while completing the *Adequate Legal Authority, Source Identification,* and *Discharge Characterization* sections of the permit application (See Chapters 3, 4, and 5, respectively.)

During the term of the permit, as additional information becomes available, the municipality should target and set priorities for other program elements that emerge. For example, if the municipality has incomplete characterization data about waste handling sites identified in this program component because the inventory of dischargers to the MS4 has not been completed, the municipality could propose to direct monitoring programs to those areas. Upon acquiring sufficient characterization data, the priority of the sites discharging to these portions of the MS4 can be either determined or modified.

As noted above, when identifying priority sites, applicants must consider all the facilities listed in §122.26(d)(2)(iv)(C)(1). When municipalities develop criteria for identifying additional priority industrial facilities, they are advised to consider, at a minimum:

- The type of industrial activity (SIC codes can help characterize the type of industrial activity);
- The use and management of chemicals or raw products at the facility and the likelihood that storm water discharge from the site will be contaminated; and
- The size and location of the facility in relation to sensitive watersheds.

6.3.3.2 Developing Procedures

This program component should describe the specific steps that the municipality will take if it identifies a waste handling site or priority industrial facility when preparing the Part 2 application or during the permit term [§122.26(d)(2)(iv)(C)(1), printed in the box above]. The proposed management program must include procedures for inspecting priority industrial sites. The results of inspection may be used as a basis for requiring storm water management controls and enhanced pollution prevention measures. It should also establish an inspection schedule for each priority facility at the time it is identified.

Applicants may want to consider establishing prior notification procedures. The applicant will need to evaluate the legal authority it has over priority facilities to determine if prior notification is required. This is another example of how EPA expects the different components of the application process to be linked. In this instance, the Adequate Legal Authority section is tied directly to the prior notification procedure of the inspection and evaluation component of the proposed management plan.

Applicants also should consider developing inspection documents such as standard forms or checklists for recording observations. Forms and checklists can be used to identify high risk areas of priority facilities and to make comparisons among sites. When characterization data or baseline estimates are factored into the evaluation process, the effectiveness of pollution prevention activities at a particular site could be quantified and compared to similar sites. Other procedures that applicants should describe to effectively incorporate inspections as well as establish and implement control measures for these types of discharges can be derived from monitoring data.

Applicants also should describe a procedure for conducting follow-up inspections, where necessary, as part of this program component. For example, follow-up inspections might be needed to verify the installation of a specific control or implementation of a practice specified in a negotiated agreement between the municipality and the industrial site. A system-wide approach to establishing priorities for inspection procedures is recommended. The system-wide approach should begin with the evaluation of existing information, followed by the identification and evaluation of new information during the permit term. Therefore, applicants should link these procedures with information from the *Source Identification* and *Discharge Characterization* components.

6.3.3.3 Establishing and Implementing Controls

A municipality must consider if it should place more stringent controls on discharges associated with industrial activity than are required in an industrial facility's existing NPDES storm water permit [§122.26(d)(2)(iv)(C)(1), printed in box above]. Usually, the municipality will not need to impose controls beyond those required in the industrial facility's NPDES storm water permit (for more information on appropriate controls, refer to *Storm Water Management for Industrial Activities, Developing Pollution Prevention Plans and Best Management Practices*, EPA 832-R-92-006, September, 1992).

However, nothing in the Federal regulations would prohibit the municipality from requiring additional controls beyond the permit requirements for industrial activities. For this reason, EPA recommends that municipal applicants incorporate a provision in the proposed storm water management program that allows the municipality to require priority industrial facilities to implement the controls necessary for the municipality to meet its permit responsibilities.

Finally, the applicant should suggest procedures for requiring pollutant control measures in runoff from priority industrial facilities. Applicants should provide information to the industrial facilities that discharge to the MS4s and industry-specific guidance on appropriate control measures that industries discharging to their systems should follow (WDOE, 1991).

Priority industrial facilities should focus on controlling activities such as the use, storage, and handling of toxic chemicals. Standard methods for implementing control measures at different types of facilities should be described. To facilitate this, municipalities should obtain copies of the pollution prevention plans developed by industrial permittees. Control measures that the municipality may suggest include preventing exposure of pollutant sources to precipitation, on-site pretreatment, and oil/water separators. Applicants should provide a schedule for setting up this program component at priority industrial facilities. The schedule should include educational services for industrial site operators and technical BMP guidance, training courses, videos, workshops, and seminars for plan reviewers, inspectors, contractors, and developers.

6.3.3.4 Inspection and Monitoring

The proposed management program should describe the inspection procedures that will be followed. Storm water inspections can be coupled with inspections for other purposes (e.g., pretreatment programs, fire and safety). Proposed management programs should address minimum frequency for routine inspections. For example, how often, how much of the site, and how long an inspection may take are appropriate to explain in this proposed management program component. Applicants should also describe procedures for conducting inspections and provide an inspector's checklist.

In addition, these inspection procedures should identify the minimum number of inspectors that will be employed and describe

the programs to train them. For example, if the number of inspectors is expected to increase over the term of the permit, it should be noted in the proposed management program. Also, if storm water inspections are combined with other program inspections, means of cross-training inspectors and coordinating schedules should be outlined.

Municipalities are urged to evaluate pollution prevention plans and discharge monitoring data collected by the industrial facility to ensure that the facility is in compliance with its NPDES storm water permit. Site inspections should include (1) an evaluation of the pollution prevention plan and any other pertinent documents, and (2) an on-site visual inspection of the facility to evaluate the potential for discharges of contaminated storm water from the site and to assess the effectiveness of the pollution prevention plan. A municipality could begin the inspection process with information from the facility's notification to the municipality, which should have been submitted by May 15, 1991. Industrial facilities must also submit an individual NPDES permit application, participate in a group storm water permit application, or file a Notice of Intent (NOI) to be covered by a general permit to the NPDES permitting authority. Section 308 of the CWA provides the legal authority for any individual (including a municipality) to obtain information from the NPDES permitting authority.

The proposed management program also must include a description of a monitoring program for storm water discharges associated with industrial facilities [§122.26(d)(2)(iv)(C)(2)].

The monitoring program should describe the framework and rationale for selecting monitoring sites. Sites that may be appropriate for monitoring include locations with several upstream industrial facilities, industrial facilities that are representative of a significant number of similar facilities, and priority industrial sites with significant potential for high levels of pollutants in their storm water discharges. The description of the proposed monitoring program should address how the monitoring data will be used and what the frequency of the monitoring will be.

> **§122.26(d)(2)(iv)(C)(2). [The application must describe] a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of qualitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).**

Identifying who will actually conduct the monitoring (e.g., industry or municipality) is appropriate to include in the program description. Linking this element of the monitoring program to the Adequate Legal Authority section of the permit application is vital. The legal authority to require monitoring should prescribe the specific monitoring protocols required elsewhere in the regulation [§122.26(d)(2)(i)(F)]. Applicants should describe proposed procedures for monitoring industrial facilities, including methods for determining parameters to be sampled throughout the term of the permit. **At a minimum, parameters that must be considered for monitoring include:**

- Any pollutant limited in effluent limitations guidelines for the subcategory of industry;
- Any pollutant that is controlled in a NPDES permit for the process discharge from an industrial site;
- Oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen; and

State of California

Memorandum

: Catherine Tyrrell
Assistant Executive Officer
Los Angeles RWQCB

Date: APR 17 1996

Jorge A. León
Senior Staff Counsel

From : OFFICE OF THE CHIEF COUNSEL
STATE WATER RESOURCES CONTROL BOARD
901 P Street, Sacramento, CA 95814
Mail Code G-8

Subject: LEGAL ISSUES RAISED IN DRAFT STORM WATER WDR/NPDES PERMIT FOR LOS ANGELES COUNTY ET AL.

You have asked that I respond to legal issues raised in comments submitted by the principal permittee, copermittees, and interested parties during the development of the current draft of Waste Discharge Requirements/NPDES Permit (permit) for Los Angeles County and the copermittee cities.

As background to the storm water permitting process, the federal Clean Water Act (CWA or Act) provides that the U.S. EPA Administrator, or States with delegated authority, shall issue National Pollutant Discharge Elimination System (NPDES) permits to control discharge of pollutants into surface waters. California is a delegated state for NPDES purposes. Section 402(p) (33 USC § 1342) requires that storm water discharges be addressed through the NPDES permitting process. Section 402(p) provisions applicable to municipal permits read as follows:

> "Municipal discharge. Permits for discharges from municipal storm sewers . . . .
>
> "(i) may be issued on a system- or jurisdiction-wide basis;
>
> "(ii) shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers; and
>
> "(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other

provisions as the Administrator or the State determines appropriate for the control of such pollutants." (§ 402(p)(2)(B).)

The language of Section 402(p) is notably brief and provides a great deal of discretion to the U.S. EPA Administrator and to delegated states. To assist the states and affected parties in interpreting the CWA's provisions, the U.S. EPA issued regulations in 1990 that implement and interpret Section 402(p). They are found at 40 CFR Part 122.26. Along with the regulations, the U.S. EPA released a "Final Rule" that contains its responses to comments received during the rulemaking, and in large measure, illuminates the U.S. EPA's interpretation of the CWA requirements. Later, the U.S. EPA published its "Guidance Manual For the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems", which contains further guidance.

Below, I have paraphrased the comment that raises each legal issue, followed by my response.

1. *Under the terms of the current draft, the Executive Advisory Committee (EAC) could be held legally responsible for compliance with the provisions of the permit. The Regional Board has no authority to require an EAC nor can it dictate the composition of the EAC.*

As I understand it, the EAC provisions of the permit were included in a response to a proposal contained in the permit application submitted by Los Angeles County on behalf of the copermittees, and, to facilitate administration of the permit, given the complexities involved in obtaining the involvement of 86 copermittee cities. It is evident that for the permit to be successfully implemented, some form of leadership among the copermittees is necessary. In this connection, I note that 40 CFR 122.26(d)(2)(iv) requires "where necessary, intergovernmental coordination" in developing and implementing a storm water management program. Recognizing the absence of any specific requirement for an EAC, the provision was contemplated as a voluntary effort to further the success of the permit implementation.

Turning to the liability issue, the previous draft provided that the EAC would implement certain permit requirements. The current (December 18, 1995) draft is revised to clarify that the EAC provides direction to the County and the cities, who are the actual dischargers under the permit. The dischargers remain responsible for implementation of the permit requirements. The EAC members themselves, in their role as

members of the EAC, are neither permittees nor dischargers. As such, they cannot personally or as a group be required to do anything under the permit. The legal responsibility for implementation of the permit requirements remains with the County and the cities.

On the issue of the Regional Board's authority, if there remains opposition to the EAC provisions, I recommend that staff delete all requirements regarding the EAC and, instead, expand the Findings to discuss the EAC proposals provided by the dischargers themselves. In that way, we memorialize the fact that the dischargers suggested the approach and mention a leadership mechanism while deleting any objectionable mandatory requirements. The permittee and the copermittee thus assume all responsibility for appropriate implementation of the permit.

2. *The Administrative Review provisions regarding issuance of a Notice of Intent to Meet and Confer violate the permittee's due process rights in that the city is not afforded notice and an opportunity to be heard.*

These provisions were drafted to create an informal dispute resolution process for the benefit of the cities. The Administrative Review provisions constitute a voluntary mechanism intended to resolve compliance issues in an informal manner prior to commencement of formal enforcement. "Due Process" applies only to State action that would deprive the subject of property or other rights. Since the Administrative Review process precedes (and ultimately seeks to replace) formal enforcement actions, there is no loss of property or other rights and, thus, there can be no loss of due process rights. To the extent that the comment seeks an additional level of notice and opportunity to be heard, I would recommend against it, since to do so would defeat the purposes of informal resolution.

Additionally, the analysis above regarding the EAC is also pertinent to the Administrative Review component of the permit. That is, the relevant provisions in the draft permit were developed to facilitate administration of the permit, although staff recognizes that there is no specific authority to require inclusion of such provisions. If voluntarily accepted by the dischargers, it can be included for the purpose of promoting effective communication regarding compliance with the permit, and to avoid enforcement actions. Removal of these provisions would remove an apparently desirable dispute resolution mechanism preceding enforcement action. However, if there

remain objections to the provisions, as with the EAC, I recommend deletion.

3. *The NRDC and other entities should be required to participate in the Administrative Review process to resolve differences and be bound by the results.*

To the extent that the NRDC and other nondischarging observers agree to be so bound, they are free to negotiate a document memorializing that agreement with the dischargers. However, the Regional Board does not possess any authority over nondischarging entities. The Regional Board's authority in issuing the permit is limited to controlling the conduct of dischargers which affects water quality. It does not extend to the conduct of nondischargers. Indeed, the CWA provides certain rights to citizens, including the right to file a citizen's suit challenging the failure to properly implement CWA provisions. Adoption of the proposed comment would infringe on that right. Thus, the Regional Board may not require that the NRDC or others participate in or be bound by the Administrative Review process.

4. *Final determinations made by the Executive Officer during the Administrative Review process should be subject to appeal to the Regional Board.*

Under Water Code Section 13263(e), all <u>final</u> determinations made by the Executive Officer involving waste discharge requirements are subject to review by the Regional Board. Non-final decisions are not reviewable because it would create duplication and impede final resolution of issues. A provision can be added to the Administrative Review section to satisfy the comment, to the effect "Final determinations made by the Executive Officer at the conclusion of the Administrative Review process are subject to review by Regional Board pursuant to Water Code Section 13263(e)."

5. *The draft permit exceeds State and Federal requirements for storm water programs. Programs required under the permit should be limited to those required under the Clean Water Act.*

By its express terms (Section 402(p)), the Act requires that the municipalities implement controls to reduce the discharge of pollutants in storm water to the maximum extent practicable (MEP) and must not exceed water quality standards. The State's obligation is to interpret this provision to give effect to the purposes of the Act. The programs required under the permit are consistent with this mandate. The permit contemplates programs that will reduce the discharge of pollutants to the

maximum extent practicable. Rather than exceeding the CWA requirements, the permit provisions describe storm water program components that minimally fulfill the CWA mandate.

For example, another comment states, "The Clean Water Act does not regulate 'parking lot pollution'".

The U.S. EPA states in the Final Rule as follows:

> "The Administrator or NPDES State has the authority under section 402(p)(2)(E) of the amended CWA to require a permit prior to October 1, 1992, by designating storm water discharges such as those from parking lots that are significant contributors of pollutants or contribute to a water quality standard violation." (Federal Register, Vol. 55, p. 48010.)

Studies demonstrate that parking lot storm water discharges are significant sources of pollutants. See Pitt et al., Urban Storm Water Toxic Pollution, Assessment, Sources, V. 67, pp. 260-275; Western States Petroleum Association and American Petroleum Institute, Results of Retail Gas Outlet & Commercial Parking Lot Storm Water Runoff Study (Geomatrix Consultants), 1994. Since the Act does not exempt a source that is a significant contributor of pollutants, it is appropriate to address parking lot pollution in the municipal storm water permit.

6. *Who determines what is the "maximum extent practicable?"*

It is up to the principal permittee and the copermittees initially to propose actions that implement best management practices to reduce pollution to the MEP. It is the Regional Board's responsibility, however, to evaluate the proposed programs using appropriate guidance. Neither the CWA nor the U.S. EPA has defined MEP. However, the issue has been analyzed in some detail in a memorandum prepared by Elizabeth Miller Jennings, Senior Staff Counsel, Office of Chief Counsel, State Water Resources Control Board, dated February 11, 1993 (copies of which can be provided on request). The following excerpt provides the factors that we need to consider in determining MEP:

> "Although MEP is not defined by the federal regulations, use of this manual in selecting BMPs should assist municipalities in achieving MEP. In selecting BMPs which will achieve MEP, it is important to remember that municipalities will be responsible to reduce the discharge of pollutants in

storm water to the maximum extent practicable. This means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. The following factors may be useful to consider:

"1. Effectiveness: Will the BMP address a pollutant of concern?

"2. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?

"3. Public acceptance: Does the BMP have public support?

"4. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?

"5. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

"After selecting a menu of BMPs, it is of course the responsibility of the discharger to insure that all BMPs are implemented."

The Regional Board's role is to review BMPs suggested by the municipalities and determine MEP using the above guidance and the court's decision in NRDC et al. v. California Department of Transportation Federal District Court, Central District of California (1994). The court stated that a permittee must evaluate and implement BMPs except where (1) other effective BMPs will achieve greater or substantially similar pollution control benefits; (2) the BMP is not technically feasible; or (3) the cost of BMP implementation greatly outweighs the pollution control benefits.

7. *The draft permit unjustifiably imposes an unnecessary burden by requiring that the cities conduct inspections of industrial/commercial facilities and to determine whether an NOI has been submitted to the State Board, whether a SWPPP is available on-site, and to notify the Regional Board staff of noncompliance with these and any other requirements as determined appropriate by the permittee.*

The U.S. EPA has provided guidance on this issue. Its language in the Final Rule (Federal Register, Vol. 55, p. 48056) indicates that it contemplates that the cities will arrange for inspections as necessary to assure success of the storm water programs:

> "Today's rule also requires the municipal storm sewer permittee to describe a program to address industrial discharges that are covered under the municipal storm sewer permit. Today's rule requires the municipal applicant to identify such discharges . . . , provide a description of a program to monitor pollutants in runoff from certain industrial facilities that discharge to the municipal separate storm sewer system, identify priorities and procedures for inspections, and establish and implement control measures for such discharges. Should a municipality suspect that an individual discharger is discharging pollutants in storm water above acceptable limits, and the owner/operator of the system has no authority over the discharge, the municipality should contact the NPDES permitting authority for appropriate action."

Furthermore, the federal regulations, at 40 CFR 122.26(d)(2)(i)(F) require that municipalities demonstrate legal authority to:

> "Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm water sewer."

The inclusion of this requirement in the regulations supports the conclusion that it was the U.S. EPA's intent to require the municipalities to carry out those inspections. The provisions of the permit regarding inspections are drafted in an attempt to make the cities' increased role as manageable as possible. They are drafted to allow the cities to meet their obligation to inspect facilities for compliance with permit requirements as part of the inspection and enforcement process which the permittees are already required to implement pursuant to guidelines issued pursuant to CWA Section 402(p) and any other inspection programs that they may undertake. Inspection staff can comply with the permit requirements by making additional observations at facilities that are inspected, take additional notes and share appropriate information with the Regional Board staff. There may be room for negotiating the specific types of

facilities which must be inspected and the inspection frequencies, but it is clear that the CWA contemplates some level of inspection by the copermittees.

8. *City and County inspectors will need an administrative inspection warrant to gain access to private property to inspect facilities. The cities would have to embark upon the burdensome process of obtaining an administrative warrant to enter such properties. The permit requirement that cities inspect nonpermitted facilities exceeds CWA requirements.*

As noted above, the CWA and the implementing regulations found at 40 CFR 122.26 must be interpreted in a manner to carry out the purposes of the Act. As noted above, the U.S. EPA's guidance on the matter makes it clear that the CWA and the federal regulations seek to impose an inspection responsibility on the permittees. 40 CFR 122.26 (d)(2)(i)(F) expressly requires that the permittees demonstrate or obtain the authority to conduct inspections. To the extent that cities do not presently possess authority to inspect, they will obtain such authority in compliance with this regulation.

Generally, the County and cities should presently possess authority to enforce and ensure compliance with their various permits, such as for construction and business. The County and cities should be able to rely on that authority to gain access to private property in the majority of cases to assure compliance with the storm water permit requirements. In the much smaller number of cases, where the inspectors are unable to gain consensual entry to premises, they may have no right of entry without a warrant. The process involves drafting the warrant documents, obtaining a judge's signature, providing advance notice of execution of the warrant, and, if met with resistance, enlisting cooperation of the local police to gain access for inspection purposes. Certainly, this will create an additional burden for those cases where consensual access is not available, and, while there is no accurate way to predict the proportion of consensual versus nonconsensual cases, it is possible that over time, the process could become routinized, resistance to such inspections reduced and, therefore, the burden to obtain warrants, reduced.

9. *The federal regulations provide that certain identified discharges are to be addressed only when the municipality identifies the discharges as a source of pollution. The permit proposes to prohibit certain activities that have not been so identified by the municipalities. The permit's exemptions should mirror the federal regulations.*

The federal regulations promulgated pursuant to CWA Section 402(p) require permittees to "effectively prohibit" all non-storm water discharges to the MS4 except those that have been issued a separate NPDES permit. However, the regulations treat a discreet list of nineteen categories separately. As to these, the municipal permittees need not prohibit their discharge unless they are identified as a source of pollutants. (40 CFR § 122.26(d)(2)(iv)(B)(1).) The December 18, 1995 draft permit includes the nineteen exempt categories in two separate groups: "Exempted Discharges" and "Conditionally Exempted Discharges." The latter group includes additional categories of non-storm water discharges not listed as such by the U.S. EPA, but which the municipalities requested be exempt.

The Regional Board requires separate NPDES permit coverage for ground water discharges and hydrostatic testing (this includes waterline flushing and potable water sources) because of region-specific contamination concerns. In addition, the Regional Board has historically required that public/municipal swimming pool discharges be covered by a separate NPDES permit.[1]

In order to avoid a conflict with these Regional Board policies, I recommend that the draft permit follow the federal list of non-storm water exemptions, except for three categories: (1) uncontaminated ground water; (2) discharges from potable water sources; (3) water line flushing; and (4) dechlorinated public/municipal swimming pools discharges. The Regional Board may consider adopting a policy in the future, as appropriate, to resolve any conflicts in this area.

Regarding additional categories that permittees requested be exempted but are not in the U.S. EPA's list of nineteen, these may be handled under the draft permit's "Procedures for Exemption." In order to be considered, permittees must demonstrate that strategies for minimizing pollutant discharges have been developed, or show that the non-storm water discharge is not a potential source of pollutants to the MS4.

10. *The legal authority requirements should apply to the primary operator of the MS4 and the principal permittee (the County), rather than the copermittee cities.*

40 CFR Part 122.26 (d)(2)(i) requires a demonstration that the applicant can operate pursuant to legal authority established

---

[1] *Section 402(p) requires that facilities already under permit shall remain covered under a separate NPDES permit.*

by statute, ordinance, or series of contracts which authorizes or enables the applicant at a minimum to:

> "(A) Control through ordinance, permit, contract, order, or similar means, the contribution of pollutants to the municipal storm water sewer by storm water discharges associated with industrial activity and the quality of storm water discharges from sites of industrial activity;
>
> "(B) Prohibit through ordinance, order, or similar means, illicit discharges to the municipal separate storm sewer;
>
> "(C) Control through ordinance, order, or similar means, the discharge to a municipal separate sewer of spills, dumping or disposal or materials other than storm water;
>
> "(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;
>
> "(E) Require compliance with conditions in ordinances, permits, contracts, or orders; and
>
> "(F) Carry out all inspection, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer."

The U.S. EPA's Guidance Document provides assistance on the issue whether the County alone can be required to provide the legal authority demonstration:

> "When two or more municipalities submit a joint application, each coapplicant must demonstrate that it individually possesses adequate legal authority over the entire municipal system it operates or owns. A coapplicant need not fulfill every component of legal authority specified in the regulations, as long as the combined legal authority of all coapplicants satisfies the regulatory criteria for every segment of the MS4 (including authority over sources that discharge to the MS4) . . . .

> "Coapplicants also may use interjurisdictional agreements to show adequate legal authority and to ensure planning, coordination, and the sharing of the resource burden of permit compliance. When more than one entity is submitting an application for a MS4 (either as coapplicants or as individual applicants for different parts of a system), the role of each party must be well defined. Each applicant or coapplicant must show the ability to fulfill its responsibilities, including legal authority for the separate storm sewers it owns or operates." (Section 3.2.3)

This guidance makes clear that the cities and the County must coordinate with each other to assure that there is the necessary legal authority either in the County or in the cities, or through some combination of authority, to control the discharge of pollutants in all parts of the municipal separate storm sewer system.

11. *The legal authority requirements are unclear.*

In summary, the copermittees must demonstrate to the Regional Board that they possess the legal authority to implement the required actions provided in 40 CFR 122.26(d)(2)(i)(A)-(F). Subject to the Response to Comment No. 10, above, each permittee's municipal attorney should provide a statement that he/she has reviewed the city's ordinances and has determined that they provide the necessary authority. If the permittee does not currently have an effective ordinance(s) that provides the required authority, it must provide a schedule setting forth when it will adopt or amend its ordinances to provide the necessary authority.

Once each permittee has so demonstrated, it is required to enforce those ordinances to the extent required to effectively control discharges to and from those portions of the MS4 over which it has jurisdiction, as required by the permit.

12. *No city attorney will be able to certify that the city possesses legal authority to implement the permit because the permit requires inspections that may infringe on the rights of private parties.*

The current draft eliminates the requirement that the city attorney "certify" legal authority. Regarding authority to implement the permit, the comment confuses two separate issues. The permit requires compliance with the legal authority requirements as provided at 40 CFR Part 122.26(d)(2)(i)(A)-(F). This requirement can be met simply by providing information

about the ordinance that provides the stated authority, or a schedule in which such ordinance will be adopted. That is all that a city attorney needs to consider. The issue regarding inspections is an entirely separate matter and it does not need to delay compliance with the straightforward legal authority requirements. Specifically, the issue regarding inspections is whether the permit requirements themselves regarding inspections are appropriate. That issue is treated in responses to Comments 3 and 4, above.

13. *The stated goals of the Countywide Guidelines would unrealistically and unlawfully target new development to improve existing conditions, rather than preventing water pollution by storm water discharges.*

The current draft has been modified to clarify that the requirement is to preserve--rather than create--existing beneficial uses. To the extent that the comment suggests that the permit applies disproportionately to existing facilities and new development, requiring the latter to take on greater responsibility for control of storm water pollution, a review of the permit shows this to be unfounded. Many more of the permit's requirements apply to existing residential, commercial, and industrial facilities.

14. *The Regional Board does not have authority to adopt watershed management plans that effectively preempt local land use control.*

CWA Section 402(p) provides that municipal storm water permits, "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices . . . ." As interpreted and implemented in the federal regulations, 40 CFR 122.26(d)(2)(iv)(D) requires:

> "A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include: [1] A description of procedures for site planning which incorporate consideration of potential water quality impacts."

Municipalities are authorized under their planning authority to control land use decisions. The above regulation clearly contemplates that municipalities exercise their planning power in such a manner that considers potential water quality impacts. Pursuant to these directives, the permit requires

consideration of watershed planning elements to control pollution from affected sources.

The permit requires actions consistent with existing law, including those concerning local land use control, and should not be read as preempting those laws. The intent has been to facilitate, to the extent allowed by law, smooth implementation of applicable provisions of the CWA and to ensure consistency with the Coastal Zone Act Reauthorization Amendments (CZARA). Under CZARA, management measures have been prescribed by the U.S. EPA and National Oceanic and Atmospheric Administration (NOAA) applicable to construction activity regardless of land size.

15. *Provisions of the permit dictate the manner in which the dischargers are to comply with its requirements, in violation of Water Code Section 13360.*

Water Code Section 13360 clearly provides a restriction on the ability of the Regional Boards to dictate the manner of compliance with State requirements. However, Water Code Section 13377 provides that, notwithstanding Section 13360, the Regional Boards shall issue waste discharge requirements which apply and ensure compliance with all applicable provisions of the CWA. Inasmuch as the permit seeks to implement CWA requirements, it does not violate Section 13360 for the Regional Board to include specified programs that must be implemented by the municipalities in order to carry out CWA requirements. This is made all the more necessary by the elimination of numerical limits from the permit. Reliance on BMPs requires specification of those programs that are relied upon to reduce pollution.

16. *The decision-making authority of a city rests with its city council, and it cannot be delegated, except within narrowly prescribed limits, to a representative on the WMC.*

As I understand it, the intent of the permit is to assure representation by city staff of sufficiently high level to accomplish implementation of programs within narrow time limits, and avoid wasted time. Further discussion should identify the appropriate staff, or the extent of permissible delegation, and if none is available, other acceptable mechanisms for the WMC to achieve its objectives, including procedures that would allow the representatives to take issues back to their respective city councils for approval.

17. *The BMP substitution provisions unlawfully delegate to the Executive Officer authority to prescribe permit requirements.*

The provisions were put into the draft permit in order to allow the cities a streamlined means of allowing for BMP substitution. If an acceptable provision cannot be drafted along the lines described below, it should be deleted. BMP changes would thus be taken to the Board for approval.

The current draft provides that the Executive Officer approve modifications only where he/she finds that the proposed change will (1) achieve greater or substantially similar reduction in storm water pollutants, and (2) be implemented within a similar period of time. These criteria are sufficiently detailed to constitute an appropriate authorization to the Executive Officer.

18. *The cities have no legal authority to control discharges on federal and certain other facilities within the cities' jurisdiction.*

The permit may properly require only control of discharges to the extent allowed by law. The provisions of the permit are not intended to, and legally cannot, expand the cities' authority over such facilities as federal properties. The appropriate permit language should be clarified to exclude obligations by the cities over federal properties located within its boundaries, state-owned properties, state parks, and state universities.

19. *The Permit constitutes rulemaking subject to the APA.*

The essence of the argument appears to be that, because the Regional Board staff has relied upon studies, guidance manuals, reports, portions of other permits, and staff input to produce the draft permit, and those underlying documents have not been subjected to scrutiny under the APA, the permit itself constitutes rulemaking subject to the APA. I do not agree.

Government Code Section 15375 defines a "permit" as:

> "[A]ny license, certificate, registration, permit, or any other form of authorization required by a state agency to engage in a particular activity or act."

The draft storm water waste discharge requirements for Los Angeles County constitute a permit within the meaning of the Government Code. Permits issued pursuant to Water Code Section 13262 or 13377 are not subject to the APA. (Government Code § 11352.) The fundamental distinction between permit issuance and rulemaking is that the former is a quasi-judicial process involving a specific discharger or group of dischargers

based upon facts unique to the discharger or group, while the latter is a quasi-legislative exercise aimed at regulating the public in general, based upon general facts.

By definition, permit issuance involves the identification and imposition of applicable standards to allow the permittee or permittees to discharge storm water. That is what the draft permit seeks to accomplish. The fact that the draft permit makes use of materials not previously subjected to the APA does not, as the comment suggests, impose upon any group, any perceived requirements in those materials and documents. That would be rulemaking subject to the APA. None of the arguments raised by the commenters affect the essential difference between rulemaking and permit issuance.

Furthermore, the process for adoption of the permit provides safeguards not unlike the APA's procedural requirements. Both provide for notice, opportunity to comment, response requirements, and hearing before the Board. The process provides for airing of all comments to provisions in the permit by those subject to permit and by other interested parties. The commenters' invitation to embark upon a rulemaking process in order to adopt the permit should be declined as it would unavoidably confuse the distinction between rulemaking and permit issuance. Moreover, the Regional Boards have not historically engaged in rulemaking under the APA. That function has been performed exclusively by the State Board in its discretion. To require each Regional Board to engage in separate rulemaking actions to support their storm water permits is not only time- and resource-intensive, but creates the undesirable potential for conflicting results.

20. *Reimbursement for State Mandates. The permit will require numerous programs which the cities will have to fund. To the extent the storm water permit requirements constitute federal requirements, the State may not properly shift the cost of those programs to the cities, without providing a funding mechanism.*

Section 6 of Article XIII B of the California Constitution requires the state to reimburse local government for the costs of complying with any new program or higher level of service mandated by either the Legislature or any state agency. In developing this storm water permit, the Regional Board is implementing provisions of the CWA and applicable regulations, which are federal laws. The SWRCB has previously determined that in several circumstances, Regional Board orders are exempt from the requirement for reimbursement. Among the reasons is that the orders implement federal and not state law. See The

City of San Bernardino (1991) Order No. WQ 91-08. As noted in other responses to comments, the permit requirements are intended to require the minimal programs and activities necessary to carry out the intent of the CWA, which is to assure reduction to the maximum extent practicable the discharge of pollutants in storm water. The Regional Board has not relied upon its discretion under State law to implement more stringent requirements than those set forth under the CWA.

21. *The information gathering requirements (developing a computer database, obtaining information from permittees, conducting inspections, preparing reports) exceed the CWA and federal regs, and are in violation of 44 U.S.C. Sections 3501, et seq. (Paperwork Reduction Act) and would require hiring additional staff.*

The current draft reduces the reporting frequencies and the detail of required reporting. The aspects of this comment concerning obtaining information from permittees and the need to hire more staff is addressed in the comment/response dealing with inspections. As to the manner of report submittal, the Regional Board may request that reports be submitted in a particular format, including electronic.

The Paperwork Reduction Act (PRA) applies to collection and use of information by federal agencies, not state agencies. 44 U.S.C. Section 3502(1). Even if it were applicable to collection and use of information by state agencies, the reporting requirements do not violate the PRA so long as the required reports are "necessary for the proper performance of the functions of the agency." 44 U.S.C. § 3508. Clearly, the reporting requirements are necessary to assure compliance with the permit.

22. *The County has no authority to require a city to cease discharges that occur in the city but enter county-operated storm water conveyances. Who is liable for cleanup costs?*

This is the kind of issue that should be resolved among the County and the cities themselves, as copermittees pursuant to interagency agreement authority. The cities among each other, and the County and the cities should consider entering into memoranda of understanding to apportion their respective responsibilities in such cases.

23. *Regarding Section II.B., the cities should not be required to assume any responsibility for cleanup if the owner/operator does not address a problem.*

The EPA's guidance indicates that the cities have responsibility for assuring that owner/operators do not cause illegal storm water discharges. It follows that the cities have responsibility to assure that owner/operators who cause pollution will address pollution problems they have caused through enforcement actions. The cities assume cleanup responsibility under their obligation to assure prevention of discharges of pollutants into storm water channels. Otherwise, that responsibility is illusory.

24. *The permit improperly seeks to shift responsibility for control of Industrial/Commercial sources of pollution to the cities.*

The permit places responsibility for control of these sources at the same place that the U.S. EPA places the responsibility: with the municipalities. The US EPA notes in the Preamble to the Storm Water Regulations that municipalities are in the best place to enforce compliance with storm water discharge requirements.

> "Because storm water from industrial facilities may be a major contributor of pollutants to MS4s, municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program . . . . The CWA provides that permits for municipal separate storm sewers shall require municipalities to reduce pollutants to the maximum extent practicable. Permits issued to municipalities for discharges from municipal separate storm sewers will reflect terms, specified controls, and programs that achieve that goal."

Federal Register, Volume 55, Number 222, p. 48000. Again, at p. 48006, the U.S. EPA stated:

> "Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that controls be placed on storm water discharges associated with industrial activity which discharge through the municipal system."

It is clear from these passages that the U.S. EPA interprets the CWA as requiring control of industrial/commercial discharges by the municipalities. The draft permit is consistent with the EPA's interpretation.

Executive Officer
California Regional Water Quality Control Board,
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013

2000 DEC 29 P 2:28

Dear Mr. Dickerson:

The letter is in follow up to our meeting on October 5, 2000 concerning the NRDC Petition to Withdraw the NPDES storm water permit program administered by the Los Angeles Regional Board. One of the NRDC's principal concerns with the Regional Board's program is the alleged absence of an effective program for controlling pollutants in storm water discharges from industrial facilities. NRDC also recognizes, however, that the root of the problem is the lack of adequate staffing at the Regional Board to implement the program. At the October 5 meeting, we suggested that the upcoming MS4 permit reissuance for Los Angeles County require that the MS4 permittees provide more assistance to the Regional Board in this regard. We also indicated that we would provide this letter of support to the Regional Board for such requirements.

EPA's storm water permit application regulations of November 16, 1990 (55 Fed. Reg. 47990) set forth the permit application requirements for industries and municipalities and also provide guidance concerning the implementation of the program over the longer term. The storm water regulations envision a cooperative effort on the part of the NPDES permitting authority and permitted MS4s in the implementation of the industrial storm water program (55 Fed. Reg. 47997). The regulations at 40 CFR 122.26(d)(2)(iv)(C) also specifically require that MS4 permittees develop and implement controls on industrial sources which discharge into the storm sewer system, including:

> "a description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system."

The current MS4 permit for Los Angeles County requires "educational visits" by MS4 personnel to assist industrial/commercial facilities in complying with local ordinances and prohibitions. We understand that the intent of this particular requirement was to provide time for

the permittees to gain experience in controlling pollutants in storm water discharges from these facilities. Now that the permittees have had five years to gain such experience, we recommend that the next permit explicitly require that the permittees require compliance with local ordinances and implement an effective enforcement program to ensure compliance. For industrial facilities, such a requirement would be fully consistent with EPA regulations at 40 CFR 122.26(d)(2)(iv)(C). We also believe that the Regional Board's extension of the program to commercial facilities is consistent with EPA regulations at 40 CFR 122.26(d)(2)(iv)(A); however, NRDC's concerns are primarily related to industrial facilities.

Since the intent and requirements of local MS4 ordinances are usually similar (but perhaps less detailed) to the requirements of the State's general NPDES permit for industries, the above recommendation should significantly assist the Regional Board in more effectively controlling pollutants in storm water discharges from industrial (and commercial) facilities. As noted above, NRDC's concerns with the Regional Board's program are fundamentally resource-related, and by utilizing the resources of the MS4 permittees more effectively, this should help to address NRDC's concerns.

It should also be noted that the above recommendation would be nothing new for California MS4 permits. For example, the MS4 permits issued in 1996 for Orange and Riverside Counties already include explicit requirements for enforcement of local ordinances for storm water pollution control. Detailed enforcement requirements for local ordinances have also been proposed by the San Diego Regional Board for the upcoming reissuance of the San Diego County MS4 permit.

Should you have any questions regarding this matter, please call me at (415) 744-1860, or refer your staff to Eugene Bromley of the CWA Standards and Permits Office at (415) 744-1906.

Sincerely,

Alexis Strauss

James DeStefano
Interim City Manager
City of Diamond Bar
21825 E. Copley Drive
Diamond Bar, CA 91765-4178

Dear Mr. DeStefano:

Thank you for your letter of April 30, 2001, regarding EPA, Region 9's letter of December 19, 2000 to the Los Angeles Regional Board concerning requirements for inspections of industrial and commercial facilities by municipal separate storm sewer system (MS4) permittees. Your letter requested clarification of a number of issues in the December 19, 2000 letter.

As you may be aware, urban runoff is the leading cause of water quality impairment in Santa Monica Bay and the Los Angeles area. This problem, and the State's inability to apply adequate resources to its storm water program, were key factors cited in a petition filed by the Natural Resources Defense Council (NRDC) to withdraw the NPDES storm water program administered by the Los Angeles Regional Board. Current storm water fees to the State do not provide enough funds to meet all storm water program needs. In response to the NRDC petition, we met with NRDC and the State on October 5, 2000 to discuss what steps the State could take to respond to the concerns in the petition. The State had already begun to substantially increase its staffing resources devoted to the storm water program and we are continuing to discuss ways to further increase the State's investment through grant money from EPA. Also discussed were the NPDES regulatory requirements for MS4 permits, specifically the existing Federal regulatory requirement that MS4 permittees implement inspection and pollution control programs for certain industrial and commercial facilities. Such programs are already required in many MS4 permits, such as the permits for Orange, Riverside and San Diego Counties, and they play a significant role in ensuring the overall effectiveness of the storm water program through the combined efforts of the State and MS4 permittees.

The scope of an MS4 inspection program is normally negotiated with the State when a permit is reissued. We agree that a cooperative effort between the State and MS4 permittees on inspections is needed, and we believe that neither the MS4 permittees nor the State should be saddled with the entire inspection burden for industrial and commercial facilities. The State is also responsible for enforcing its general NPDES storm water permits, while the MS4 permittees need to enforce local storm water ordinances (which are often similar to the State general permits).

With regards to the intent of the "educational visits" in the existing MS4 permit, we contacted Los Angeles Regional Board staff to obtain additional information on this matter since the permit was issued by the Los Angeles Regional Board. According to Board staff, the intent of the "educational visits" in the 1996 permit was to provide a period of time during which MS4 permittees could engage in outreach activities to industrial and commercial facilities concerning storm water pollution control and best management practices which could be implemented by the facilities to reduce pollutant discharges. Since storm water pollution control was new to some facilities, the Board thought that such outreach was appropriate prior to actual enforcement of the pollution control measures. The Board also intended, however, that future permits, such as the permit under development at the present time, would require enforcement of local storm water pollution control ordinances. We believe that this is generally consistent with the characterization in our letter.

EPA has been intensively involved with all nine California Regional Boards and the State Water Resources Control Board to effectively implement the storm water program. From the initial issuance of the MS4 permits to the current round of reissuing those permits, we have been working closely with the State to encourage stakeholder participation and cooperation in the MS4 storm water programs. EPA staff have been participating in the monthly meetings between the State and the MS4 permittees to discuss the pending reissuance of the Los Angeles County MS4 permit, and we are committed to maintaining a cooperative and constructive dialogue among the stakeholders. We welcome and encourage active participation by all permittees in these monthly meetings.

Should you have any questions, please call me at (415) 744-1860, or refer your staff to Eugene Bromley of the CWA Standards and Permits Office at (415) 744-1906.

Sincerely,

Alexis Strauss 15 May 2001

Stormwater Program - Los Angeles County

March 22, 2001

Ms. Alexis Strauss
Director, Water Division
United States Environmental
Protection Agency-Region IX
San Francisco, CA 94105-3901

Dear Ms. Strauss:

LETTER DATED DECEMBER 19, 2000, TO DENNIS DICKERSON

Your December 19, 2000, letter to Dennis Dickerson recommends that the Los Angeles Regional Water Quality Control Board require that the Los Angeles County Municipal Stormwater Permittees be required to conduct inspections and enforcement of State permitted commercial and industrial facilities. As you point out, the current permit requires educational site visits of some permitted industrial/commercial facilities. However, it does not require nor contemplate that the Permittees be responsible for enforcement of compliance of State-issued permits. The Permittees lack the statutory authority to inspect and enforce facilities permitted by agencies other than them selves. ?

Los Angeles County Permittees are fully committed to enforcing their local ordinances for stormwater pollution control. The Permittees are sympathetic to the fact that the Regional Board does not have sufficient resources to enforce permits issued by them but are not in a position to legally assume the Regional Board's statutory responsibilities. The Permittees are also dealing with limited financial resources and have less capacity than the Regional Board to undertake this responsibility were it to be legally possible.

We trust that you will reconsider your recommendation. Should you wish to discuss this matter further, you are welcome to attend an Executive Advisory Committee (EAC) meeting. The EAC meets at 1:30 p.m. on the second Wednesday of each month in the 12th floor conference room of the Los Angeles County Department of Public Works, at 900 S. Fremont Avenue, in the city of Alhambra.

Very truly yours,

Desi Alvarez
Chairman
Executive Advisory Committee

1200 Pennsylvania Avenue, N.W.
Washington, DC 20460

Re: Region IX USEPA – Local Inspection Recommendation

Dear Ms. Todd-Whitman:

The City of La Cañada Flintridge would like to request clarification on a recent letter sent by Ms. Alexis Strauss, Director of the Water Division, for USEPA Region IX. A copy of the December 19, 2000 letter is attached for your review. The letter was sent as USEPA guidance to Dennis A. Dickerson, the Executive Officer of the California Water Quality Control Board, Los Angeles Region.

The December 19th letter states that USEPA's position requires that the MS4 permittees (the cities) in Los Angeles County assume legal and funding responsibilities for performing storm water compliance inspections for all State permitted industrial and commercial facilities within their boundaries. The correspondence is explained as a "letter of support to the Regional Board" for the shifting of inspection responsibilities and costs.

The December 19th letter concludes that USEPA "recommends" that the State require the cities "implement an effective enforcement program" in the next NPDES permit. The December 19th letter states that "storm water regulations envision a cooperative effort on the part of the NPDES permitting authority (the State) and permitted MS4s (the cities) in the implementation of the industrial storm water program".

There are several concerns that we have with the letter. The first concern is that no one at USEPA contacted the cities to discuss their proposed new inspection requirements. This is far from the cooperative effort that the USEPA regulations envision. The cities were not even aware of the October 5, 2000, meeting and were not invited to participate to express their concerns.

The second concern is that cities believe that USEPA failed to mention a major problem with the California program – the State's refusal to fully fund industrial/commercial inspection programs.

The State is in the position to fully fund programs since the State is running billion dollar surpluses, even after paying for electricity contracts. The State receives fees ranging from $250 to $10,000 per permit to help fund their inspection program. These fees appear adequate to fund a regular inspection program.

The shifting of new inspection responsibilities to the cities is especially egregious, since the cities have absorbed over $3.4 billion in annual property tax losses from the State since 1992. This drain of local property taxes has weakened the cities' ability to fund existing municipal services for their growing populations, much less new storm water inspection programs.

Ms. Strauss believes that the main support for shifting the inspection and enforcement responsibilities is the Clean Water Act definition of "storm water sewers". As you are aware, dry climate cities have a particular hardship with the application of Section 402 permits. In particular, the cities in my Congressional District do not operate "storm sewer systems" with centralized treatment facilities like many eastern cities.

The western climate and typography dictated in the 1930's that urban storm drain systems control rainfall in multiple areas, due to high rates of rain over short periods of time. The western systems are "flood control facilities" and not "storm sewers". The goal of a flood control system is to transport rainfall to the rivers and water bodies as quick as possible. Storm water is discharged into hundreds of localized areas along short reaches of flood control channels and rivers.

The Los Angeles County "flood control" system was designed with the primary responsibility to prevent localized flooding of residences and businesses, which occurred with regularity prior to the construction of the system. We were all reminded of the critical importance of this specialized flood control system this past February. The Los Angeles area received over 9 inches of rain that month. This rainfall was three-quarters of the average yearly rainfall. The flood control system worked, and localized flooding was minimal. This pattern of rainfall is typical for many portions of Southern California and the West.

I have a third concern with the letter. Ms. Strauss explained that the current NPDES permit for the Los Angeles County cities required "educational visits" by the cities to the industrial/commercial facilities. She stated the educational visits were to "provide time for the permittees (the cities) to gain experience in controlling pollutants in storm water" from the industrial and commercial businesses. The cities believe that this was never the intent. They did not agree to implement costly inspection programs for industrial/commercial facilities five years ago.

I would appreciate if USEPA could send a clarification letter to Mr. Dickerson. It would be helpful to the cities in my District if the letter clarified that USEPA believes that the State and the cities need to develop a "cooperative effort" in the area of inspection programs, not a program that shifts the entire inspection responsibility to the cities. It should be the goal of USEPA to bring the stakeholders together and assist in resolving conflicts, not to appear to "take sides" with the State regulators.

There is a sense of urgency to this letter, since the Los Angeles Regional Water Quality Control Board is in the process of negotiating the NPDES permit regulations. I would be happy to discuss this urgent matter with you.

Thank you for your assistance.

Sincerely,

David A. Spence

David A. Spence
Mayor

Definition in Second Draft of Permit:

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces. Where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where redevelopment results in an increase in less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the addition must be mitigated, and not the entire development.

[See pages 30-31 in State Board Order WQ 2000-11 for the revised definition of "Redevelopment" (included in next sub-section).]

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

ORDER: WQ 2000 - 11

In the Matter of the Petitions of
THE CITIES OF BELLFLOWER, ET AL., THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION
Review of January 26, 2000 Action of the Regional Board
and
Actions and Failures to Act
by both the
California Regional Water Quality Control Board,
Los Angeles Region and Its Executive Officer
Pursuant to Order No. 96-054,
Permit for Municipal Storm Water and Urban Run-Off Discharges Within
Los Angeles County
[NPDES NO. CAS614001]

SWRCB/OCC FILES A-1280, A-1280(a) and A-1280(b)

BY THE BOARD:

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Water Board) issued a revised national pollutant discharge elimination system (NPDES) permit in Order No. 96-054 (permit) to the 85 incorporated cities and the county within Los Angeles County (the County).[1] The permit covers storm water discharges from municipal separate storm sewer systems throughout the County.[2]

---

[1] This was the second storm water permit adopted for Los Angeles County and its cities. The first permit was the subject of an earlier Order. (In the Matter of Natural Resources Defense Council, Inc., Order WQ 91-04). In this permit, the County is designated as the Principal Permittee, and each city is designated as a permittee. The County is required to submit various documents on behalf of all of the permittees.
[2] The Regional Water Board has since issued a separate permit for one city, Long Beach. The relevant provisions of the Long Beach permit are similar to those in Order No. 96-054.

The permit contains provisions for the regulation of storm water discharges from development planning and construction.[3] Pursuant to these provisions, the County was required to submit Standard Urban Storm Water Mitigation Plans (SUSMPs).[4] The SUSMPs are plans that designate best management practices (BMPs) that must be used in specified categories of development projects. The County submitted SUSMPs, but the Regional Water Board approved the SUSMPs only after making revisions. The Executive Officer issued the revised SUSMPs on March 8, 2000.[5]

On February 25, 2000, the State Water Resources Control Board (State Water Board or Board) received a petition for review of the actions and failures to act regarding the SUSMPs from a number of cities, the Building Industry Association of Southern California and the Building Industry Legal Defense Foundation (jointly referred to as Cities). A second petition was received from the City of Arcadia. And a third petition was received from the Western States Petroleum Association (WSPA). On April 7, 2000, the petitioners filed amendments to their petitions, concerning the March 8, 2000 issuance of the SUSMPs. The Cities' amendment also revised the list of cities included in the petition. The Cities' petition now includes 32 cities. The petitions are legally and factually related, and have therefore been consolidated for purposes of review.[6] The petitioners also requested a stay of the SUSMPs. This request was denied by letter, dated May 11, 2000.

---

[3] Permit, Part 2.III. These provisions focus more on post-construction impacts of development than on discharges from construction activities.
[4] Permit, Part 2.III.A.1.c.
[5] These are referred to herein as the Final SUSMPs. The Final SUSMPs also apply to Long Beach, even though it is subject to a separate permit.
[6] Cal. Code of Regs., tit. 23, section 2054.

On June 7 and 8, 2000, the Board held a hearing in Torrance. Several entities, including the petitioners, the Regional Water Board, and several environmental groups[7], were designated parties. The evidence from that hearing has been included in the record before the Board. The record for comments on the petition was kept open until the end of the hearing. The parties were allowed to submit post-hearing briefs.[8]

I. BACKGROUND

In prior Orders[9] this Board has explained the need for the municipal storm water programs and the emphasis on BMPs in lieu of numeric effluent limitations. The emphasis for preventing pollution from storm water discharges is still on the development and implementation of effective BMPs, but with the expectation that the level of effort will increase over time. In its Interim Permitting Approach[10], the United States Environmental Protection Agency (U.S. EPA) stated that first-round permits should include BMPs, and expanded or better-tailored BMPs in subsequent permits where necessary to attain water quality standards. Dischargers, consultants, and academic institutions in California and nationwide have conducted numerous studies on the effectiveness of BMPs and appropriate design standards. While many questions are still

---

[7] The environmental groups are Natural Resources Defense Council, Inc., Santa Monica BayKeeper, and Heal the Bay.

[8] There are several documents that were not timely received and, therefore, are not made a part of the record before the Board. The hearing notice specified that all evidence from parties must be received by May 31, 2000. The Regional Water Board submitted documents on June 6, 2000. The hearing notice specified that policy statements were due by the close of the hearing. Several comment letters were received June 12, 13, and 19, 2000. None of these submittals are a part of the record. The post-hearing briefs were subject to a 10-page limit. The environmental groups submitted objections to the post-hearing brief submitted by the Cities. First, the environmental groups challenge the length of the brief. All briefs were subject to a 10-page limit. The Cities submitted a 10-page brief, with a 22-page attachment showing extensive proposed revisions to the SUSMPs. This submittal violates the page limit, and only the brief is considered part of the record. Second, the environmental groups claim that an e-mail message referred to by the petitioners is subject to attorney-client privilege and should not have been used in this hearing. This e-mail message, from the Regional Water Board's counsel to one of its engineers, was placed in the Regional Water Board's administrative record and submitted to the State Water Board. Any privilege that may have attached to the message has been waived and no longer exists. Finally, the post-hearing brief from the City of Arcadia was received late and will not be considered. Documents submitted late for interim deadlines (such as the deadline for submitting responses to the petitions), have been included in the record.

[9] See, especially Orders WQ 91-03 (In the Matter of Citizens for a Better Environment et al.) and WQ 91-04.

outstanding, more is expected of municipal dischargers, and many are implementing more effective programs.

While storm water management plans are improving, our knowledge of the impacts is also growing. Urban runoff has been determined to be a significant contributor of impairment to waters throughout the state. In Los Angeles specifically, beach closures are sometimes associated with urban runoff. In adopting the SUSMPs, the Regional Water Board took note of the urgent need for preventing further pollution from urban runoff and storm water discharges.

It is important to emphasize the role of the SUSMPs within the totality of regulating storm water discharges, and the purpose of these particular control measures. The requirement to prepare SUSMPS was part of the development controls in the permit. In addition to development controls, the permit requires education, public outreach, programs to restrict illicit connections and discharges, and controls on public facilities. In the context of the entire effort required by the permit, the development controls can be seen as preventing the existing situation from becoming worse.

The Final SUSMPs include a list of mandatory BMPs for nine categories of development. There are provisions that are applicable to all categories and lists of BMPs for individual categories. Requirements applicable to all categories include provisions to limit erosion from new development and redevelopment, requirements to conserve natural areas, protection of slopes and channels, and storm drain stenciling. Examples of BMPs specific to categories of discharge include design of loading docks for commercial projects and design of fueling areas for retail gasoline outlets. In most respects, the Final SUSMPs were similar to those proposed by the County. The significant departures were the inclusion of a numeric design standard for

---

[10] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits. (61 Federal Register 57425.)

structural or treatment control BMPs, and the inclusion of certain types of projects that were not covered in the County's proposal. The design standard creates objective and measurable criteria for the amount of runoff that must be treated or infiltrated by BMPs.

The record indicates that the purpose of the development controls, including the SUSMPs, is not simply to prevent pollution associated with construction runoff. As the petitioners point out, construction discharges are already subject to this Board's Statewide Construction Permit. The development controls in the SUSMPs, on the other hand, focus on post-construction runoff. They are aimed at limiting not just the pollutants in runoff from the new development, but also the volume of runoff that enters the municipal storm sewer system. By limiting runoff from new development, the SUSMPs prevent increased impacts from urban runoff generally. There is adequate technical information in the record to show that by controlling the volume of runoff from new development, BMPs can be effective in reducing the discharge of pollutants in storm water runoff.

The Procedure for Adopting the SUSMPs

The permit requires a program for controls on Development Planning and Construction. It involved a number of submissions by the County in consultation with the Cities. The first step was submission of a checklist for determining priority projects and exempt projects. The checklist was due on January 30, 1998. A list of recommended BMPs for development projects was also due on that date. The SUSMPs were due within six months of approval of the BMP list, and were to incorporate BMPs for certain categories of development. Following approval of the SUSMPs, the cities and County were to implement development programs for priority projects, consistent with the BMP list and the SUSMPs.

The BMP list was not approved until April 22, 1999. Thereafter, the County submitted proposed SUSMPs on July 22, 1999. The Regional Water Board held a public workshop on August 10, 1999. Following the workshop, the County submitted revisions to the SUSMPs on August 12, 1999. On August 16, 1999, the Regional water Board gave notice that it would discuss the SUSMPs in a public meeting on September 16, 1999. There was significant discussion at that meeting regarding the intent of the Executive Officer to approve the SUSMPs, but with revisions including a numeric design standard. At the conclusion of the meeting, the Regional Water Board members asked the Executive Officer to revise the SUSMPs and bring them back to another meeting. On December 7, 1999, the Executive Officer circulated revised SUSMPs for public review. This document incorporated a numeric design standard and made other revisions to the permittees' proposal. The Regional Water Board held a hearing on the SUSMPs on January 26, 2000. At that meeting, the Regional Water Board endorsed the SUSMPs revised by the Executive Officer, but directed him to make further changes. The Executive Officer issued the Final SUSMPs on March 8, 2000.

The Contents of the Final SUSMPs

The permit provides that the SUSMPs must incorporate the appropriate elements of the BMP list and, at a minimum, apply to seven development categories: 100-plus home subdivisions; 10-plus home subdivisions; 100,000-plus square foot commercial developments; automotive repair shops; retail gasoline outlets; restaurants; and hillside single-family dwellings.

The SUSMPs proposed by the County applied to these seven categories. Various BMPs applied to the different categories, and the SUSMPs contained narrative mitigation requirements for source control and treatment. The July proposals stated:

> "The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the storm water conveyance system."

There were no numeric design criteria for mitigation. According to various participants, earlier County drafts had included design standards to mitigate flows from 0.6-inch storm events. But any numeric criteria had been removed from the version that was submitted.

In its revised SUSMPs, submitted on August 12, the County explained in its cover letter that the mitigation language did not mean that all runoff must be mitigated. Rather, the County's intent was to omit a numerical standard from the SUSMPs. The revised SUSMPs no longer referred to mitigation at all. Instead, the following language replaced the mitigation requirement:

> "The development must be designed so as to minimize, to the maximum extent practicable (MEP), the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official."

The Final SUSMPs, as approved by the Executive Officer and the Regional Water Board, included several revisions from the County's submittal. The revision that is of greatest concern to the petitioners is the addition of Design Standards for Structural or Treatment Control BMPs.[11] The design standards require that developments subject to the SUSMPs shall be designed to mitigate storm water runoff (by treatment or infiltration) from one of the following:

> "1. The 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area..., or
> 2. The volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment..., or
> 3. The volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or
> 4. The volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles

[11] The Final SUSMPs also include the narrative language quoted from the County's August 22, 1999 proposal.

County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event."

The Final SUSMPs also applied to two additional categories of development: parking lots over 5,000 square feet or with 25 or more spaces and exposed to storm water, and to developments in environmentally-sensitive areas. Other revisions included application to all projects in the categories instead of discretionary projects only and the definition of redevelopment.

II. CONTENTIONS AND FINDINGS[12]

Contention: The petitioners contend that the Regional Water Board erred in not complying with the Administrative Review Process within the permit, and acted arbitrarily and capriciously and in violation of the Clean Water Act and state law.

Finding: The permit required the County, in consultation with the cities subject to the permit, to submit SUSMPs. The permit includes some general minimum requirements for the SUSMPs.[13] The Executive Officer is granted authority to approve the SUSMPs.[14]

The permit also contains an administrative review process.[15] The permit states that the administrative review process "formalizes the procedure for review and acceptance of reports and documents" and "provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action."[16] Following this introductory statement, the permit includes two procedures. The first is for review and

[12] This Order does not address all of the issues raised by the petitioners. The Board finds that the issues that are not addressed are insubstantial and not appropriate for State Water Board review. (See *People v. Barry* (1987) 194 Cal.App.3d 158, [239 Cal.Rptr. 349], Cal. Code Regs., tit. 3, § 052.)
[13] Permit, Part 2, III.A.1.c.
[14] Permit, Part 2, III.A.2.
[15] Permit, Part 2, I.G.
[16] *Id.*

approval or disapproval of reports and documents. The second is the dispute resolution section that must be followed prior to enforcement action.

The process for review of documents that are subject to the Executive Officer's approval is that the Executive Officer will notify the permittees of the results of the review and approval or disapproval within 120 days. If the Executive Officer does not do so, the permittees must notify the Regional Water Board of their intent to implement the documents without approval. The Executive Officer then has 10 days to respond, or the permittees may implement the program and the Executive Officer may not make modifications.

The dispute resolution procedure is to be used when the Executive Officer determines that a permittee's storm water program is insufficient to meet the permit's provisions. The Executive Officer must send a "Notice of Intent to Meet and Confer" with the permittee. A meet and confer period then ensues, resulting in a written "Storm Water Program Compliance Amendment (SWPCA)." The permittee is provided time to comply with the SWPCA. The Executive Officer is not allowed to take enforcement action against a permittee until the Executive Officer notifies the permittee in writing that the administrative review process has been exhausted and that a violation exists warranting enforcement.

The petitioners contend that the Executive Officer failed to notify the permittees that their SUSMPs were inadequate within 120 days of its submittal. The petitioners also argue that, by revising the SUSMPs without pursuing the dispute resolution process, the Regional Water Board "violated" the terms of the permit.

The provision for review of documents, which clearly includes the SUSMPs, requires that the Executive Officer notify the permittees of the results of the review and approval or disapproval within 120 days. The County submitted the revised SUSMPs on August 12, 1999.

Within 120 days, the Regional Water Board held a workshop where staff expressed their concerns with the SUSMPs. Also within 120 days the Regional Water Board itself held a public meeting where there was extensive discussion and concern by board members that the SUSMPs did not include a numeric standard. And, prior to any notification by the permittees that they would proceed with implementing their SUSMPs, the Regional Water Board held a hearing January 26, 2000, where it directed the Executive Officer to issue the SUSMPs with revisions. The Executive Officer did so on March 8, 2000.

It is clear from the record that the Executive Officer, and the Regional Water Board itself, did inform the permittees that the SUSMPs were inadequate. There was no requirement for a specific form for expressing disapproval of documents. The extensive discussion and meetings on the need for revisions to the SUSMPs, and the Executive Officer's approval of revised SUSMPs, plainly refutes the allegation that the Regional Water Board never notified the permittees of its disapproval of the County's proposed SUSMPs.

The permittees also claim that the Regional Water Board "violated" the permit by failing to institute the meet and confer process.[17] The dispute resolution process, which includes meet and confer, did not apply to the decision to disapprove the proposed SUSMPs. That process is only required when the Regional Water Board ultimately takes an enforcement action against a permittee. It is separate from the process for review and approval or disapproval of documents, and does not even appear to relate to possible enforcement actions for submission of inadequate documents. This is illustrated by the fact that the provision regarding documents refers to submittals from both the Principal Permittee and the individual permittees, while the dispute resolution provision refers only to the permittees. This distinction is relevant because the County

[17] We note that permits are issued to permittees to allow discharges to waters of the state. It is only permittees, and not Regional Water Boards, who can be charged with violating permits.

is charged with submitting the documents, while the individual permittees are responsible for compliance. A fair reading of the entire section on the administrative review process is that the review and approval or disapproval of documents applies to submission of documents by the County on behalf of the cities, while the dispute resolution process applies to enforcement actions against any permittees for failing to implement adequate programs.

Contention: The petitioners contend that the Regional Water Board was not authorized to revise the SUSMPs to add more stringent requirements.

Finding: The petitioners contend that the mitigation standards in the SUSMPs are more stringent than the requirement in the permit to reduce pollutants in storm water runoff to the maximum extent practicable (MEP)[18]. The issue of what level of protection constitutes MEP will be discussed *Infra*, in the discussion of the reasonableness of the numeric standards. But the petitioners also make certain procedural claims on this point. They argue that in approving the BMP list, the Regional Water Board determined that those BMPs constituted MEP and that the Board could not add additional BMPs in the SUSMPs. They also contend the Regional Water Board itself had no authority to "usurp" the Executive Officer's role in reviewing the SUSMPs.[19] Finally, the petitioners contend that the Regional Water Board was not authorized to mandate a program for the permittees without amending the permit.

The permit requires the County to submit a list of BMPs for approval. The Regional Water Board approved this list. Following approval of the list, the County was required to submit the SUSMPs, which must "incorporate the appropriate elements of the recommended

[18] The technology-based standard for controls under municipal storm water permits is MEP. For a fuller discussion of this standard, see Order WQ 91-03.

[19] It is undisputed that, at its January 26, 2000 meeting, the Board directed the Executive Officer to make additional revisions to the SUSMPs.

BMPs list."[20] The petitioners contend that by approving the list, the Regional Water Board determined that those BMPs constituted MEP, and that under the terms of the permit the Regional Water Board could not require additional BMPs.

In addressing this contention, we face what appears to be a fundamental misunderstanding of the numeric design standards on the part of the petitioners. The design standards are objective criteria that developers must achieve in designing their BMPs. The design standards are not separate BMPs. The standards tell what magnitude of storm event the BMPs must be designed to treat or infiltrate. They do not specify the BMPs that must be employed.

The SUSMPs as submitted by the County specify BMPs for various categories of development. Many of these BMPs are designed to minimize the pollutants in storm water runoff, by reducing flow through infiltration or by treatment. Examples of BMPs proposed by the County include infiltration basins and trenches, oil/water separators, and media filtration. The County's proposed SUSMPs also included language requiring minimizing the introduction of pollutants to the storm water conveyance system. That language remains unchanged in the Final SUSMPs. The only significant difference between the two versions of the SUSMPs was that the Regional Water Board established numeric criteria for designing the BMPs.

In adopting the Final SUSMPs, the Regional Water Board based its decision on the MEP standard.[21] The Regional Water Board did not significantly revise the BMP list or specify further the actions that developers must take to comply with the SUSMPs. Thus, we find that the Regional Water Board did not inappropriately revise its determination of what constituted MEP.

[20] Permit, Part 2, III.A.1.c.
[21] Resolution R-00-02.

The Regional Water Board is the political body responsible for water quality control in the Los Angeles region.[22] While the Regional Water Board may delegate specified powers and duties to its Executive Officer,[23] it can at any time act on its own behalf. The fact that the Board authorized its Executive Officer to approve the SUSMPs in the permit did not mean that the Board thereby denied itself the opportunity to provide direction to the Executive Officer in his approval. Such an interpretation of its delegation authority would result in an improper failure of the Board to assume responsibility for water quality in the region.

We also find that the Regional Water Board was authorized to revise the SUSMPs to achieve compliance with the permit's requirements. The SUSMPs are a part of implementation of the permit. Because the permit regulates storm water discharges throughout the entire Los Angeles region and it is implemented by 85 cities and the County, it is obvious that the permit could not spell out every detail of the program for the five-year term of the permit. Instead, the implementation is through the submission, review and approval, and implementation of various programs, including the SUSMPs.[24] Where it receives a submission that it finds is not consistent with the requirements of the permit, it is reasonable for the Regional Water Board to be able to require revisions. The Regional Water Board is not required to amend the permit each time it approves a submittal or approves a submittal with revisions. On the other hand, if the Regional Water Board's action in requiring revisions is inconsistent with the terms of the permit, then the Board should not act without first amending the permit. While the Regional Water Board could have required the County to make the revisions rather than making them itself, we see no harm in the Regional Water Board's approach.

[22] Water Code sections 13200 and 13225.
[23] Water Code section 13223.
[24] A fuller discussion of the use of storm water management plans to incorporate a developing program is found in Order No. WQ 91-03.

As will be discussed below, in most respects the Final SUSMPs are consistent with the permit. But there are some portions of the SUSMPs that are not consistent, and in those cases the SUSMPs provisions are further revised in this Order.

Contention: The petitioners make various procedural claims, including that they were denied due process, and that the Regional Water Board violated the Administrative Procedure Act, the California Environmental Quality Act (CEQA), and the California Constitution, Article XIII B, section 6 (regarding state mandates).

Finding: The petitioners point out that at the January 26, 2000 Regional Water Board hearing, there was some confusion over late changes to the SUSMPs and they contend they were not provided adequate opportunity to comment. There was significant discussion of the SUSMPs over several months. We do not agree with the petitioners that a program of this magnitude must necessarily take years to develop. But we are concerned that at the January 26, 2000 hearing, interested persons and permittees were not given adequate time to review late revisions or to comment on them. Given the intense interest in this issue, the Regional Water Board should have diverged from its strict rule limiting individual speakers to three minutes and conducted a more formal process. Such a process should provide adequate time for comment, including continuances where appropriate.[25] But to the extent the Regional Water Board's process caused any harm, this Board cured those harms. We held a two-day hearing in Los Angeles County, where all parties were allowed significant time to present their positions and testimony. In addition, we allowed the introduction of new evidence that had not been presented to the Regional Water Board. At this point, all parties have been afforded a full

[25] For future adjudicative proceedings that are highly controversial or involve complex factual or legal issues, we encourage regional water boards to follow the procedures for formal hearings set forth in Cal. Code of Regs., tit. 23, section 648 et seq.

opportunity to review the Final SUSMPs, to present their positions and evidence, and to engage in cross-examination. The petitioners' due process rights have been protected.

The Board has already addressed the contentions regarding compliance with other laws in prior decisions. The Administrative Procedure Act exempts the adoption of permits from its requirements.[26] While the SUSMPs are not a permit, they are implementing documents for a permit, and are therefore subject to the exemption. Moreover, they are relevant only to this permit, and are not a general rule of application. The constitutional provisions regarding state mandates also do not apply to NPDES permits.[27] As will be explained below, the SUSMPs as revised herein, are consistent with MEP and therefore are federally mandated. The provisions of CEQA requiring adoption of environmental documents also do not apply to NPDES permits.[28] Again, as an implementing document for the permit, there is no requirement for a separate CEQA analysis.[29]

Contention: The petitioners contend that the SUSMPs do not properly apply the maximum extent practicable standard.

Finding: The permit, consistent with Clean Water Act section 402(p)(3)(B)(iii), requires controls to reduce the discharge of pollutants to the maximum extent practicable, or MEP.[30] In approving the Final SUSMPs, the Regional Water Board acknowledged that one of the primary objectives of the municipal storm water program is the requirement to reduce the discharge of pollutants from storm water conveyance systems to the MEP.[31] While all parties appear to agree

---

[26] Government Code section 11352; See, Order No. 95-4 (In the Matter of the City and County of San Francisco).
[27] See, Order No. WQ 90-3 (In the Matter of San Diego Unified Port District).
[28] Water Code section 13389.
[29] We do note with interest the environmental groups' comment that if the permittees believed it was necessary to comply with the APA and CEQA prior to adoption of the SUSMPs, then they themselves would have violated those acts in their submissions of the proposed SUSMPs.
[30] Permit, Finding 13.
[31] Final SUSMPs, at page 2; Resolution No. R-00-02, at page 3.

that the standard for the SUSMPs is MEP, they disagree about what level of effort is necessary to comply with that standard.

The petitioners approach this issue from two angles. First, they contend that the SUSMPs will not provide water quality benefits that reflect MEP. Second, they contend that there could be adverse impacts on groundwater quality that have not been adequately evaluated.

Storm Water Design Standards as MEP

In adopting the Final SUSMPs, the Regional Water Board found that many rivers and streams in Los Angeles County are impaired for pollutants found in storm water and urban runoff, and that storm water runoff carries pollutants from nearly all types of developed properties.[32] Pollutant loading from the aggregate of development in the basin results in impairments from sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides.[33] The Final SUSMPs reflect two goals: to reduce the amounts of these pollutants in runoff and to reduce the ability of runoff to act as a conveyance system to deliver more pollutants to receiving waters. The Final SUSMPs, which include lists of BMPs and design standards requiring treatment or infiltration, address these two goals.

Clean Water Act section 402(p)(3)(B)(iii), which sets forth the requirements for establishing MEP in municipal storm water permits, provides that such permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." The United States Environmental Protection Agency (U.S. EPA), in a guidance document, explains that BMPs should be used in first-round storm water permits, and "expanded

[32] Resolution No. R-00-02.
[33] *Id.*

or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards."[34] The Clean Water Act, as interpreted by U.S. EPA, does require that, in a second-round permit,[35] expanded BMPs may be appropriate. In light of the number of water bodies impaired by runoff in Los Angeles County, it was appropriate to expand the scope of BMPs during the permit term.

The regulations implementing section 402(p) specifically require municipalities to have controls to reduce the discharge of pollutants from their storm sewer systems that "receive discharges from areas of new development and significant redevelopment," including post-construction discharges.[36] Clearly, it was appropriate for the Regional Water Board to require BMPs for new development and significant redevelopment. The permittees, who submitted their own version of SUSMPs with listed BMPs for categories of development, appear to have no real quarrel with this general mandate.

This Board has already endorsed requirements to limit the flow of the "first flush" of storm water, which may contain more significant pollutants.[37] The permittees' own version of the SUSMPs required mitigation of storm water runoff by treatment or infiltration, thus conceding the propriety of these two approaches to lessening the impact of storm water discharges. The crux of the disagreement is that the Regional Water Board added numeric design standards to establish the amount of runoff that must be treated or infiltrated, and required the mandatory application of these standards to categories of development.

The addition of measurable standards for designing the BMPs provides additional guidance to developers and establishes a clear target for the development of the BMPs. The U.S.

[34] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 Federal Register 57425 (1996).
[35] The original permit was issued in 1990. The 1996 permit is a second-round permit.
[36] 40 CFR section 122.26(d)(2)(iv)(A)(2).

EPA guidance manual suggests the use of design criteria and performance standards for post-construction BMPs.[38] The numeric criteria the Regional Water Board adopted essentially requires that 85 percent of the runoff from the development be infiltrated or treated.[39] In adopting these standards, the Regional Water Board based its decision on a research review of standards in other states and a statistical analysis of the rainfall in the area. The standard was set to gain the maximum benefit in mitigation while imposing the least burden on developers.[40] In light of the evidence of the use of this or more stringent standards in other states, the expert testimony supporting this standard, the endorsement by U.S. EPA in its comments, and the cost-effectiveness of its implementation (discussed below), the Regional Water Board acted appropriately in determining that the standards reflect MEP.[41]

We also find that the Regional Water Board appropriately applied these standards to seven of the categories listed in the SUSMPs: single-family hillside residences, 100,000 square foot commercial developments, automotive repair shops, restaurants, home subdivisions with 10 to 99 housing units, home subdivisions with 100 or more housing units, and parking lots with 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff.[42] These categories, except for parking lots, were already targeted for special treatment in the permit. The evidence shows that each listed category can be a significant source

---

[37] In the Matter of National Steel and Shipbuilding Company, et al., Order WQ 98-07, at slip opinion 7.

[38] Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Strom Sewer Systems, at page 6-4 (November 1992).

[39] Four different methods of calculation are permitted, so the percentage of capture may vary slightly.

[40] At the hearing in this matter, Regional Water Board staff explained that the standard was set at the bottom of the "knee" of the curve where the benefits of the mitigation requirements decrease and the cost increases. Other states have set the standard higher along this curve, requiring 90 to 95 percent mitigation.

[41] This conclusion in no way departs from our acceptance of BMPs in lieu of numeric effluent limitations in storm water permits. (See, e.g., Order WQ 91-03 and Order WQ 91-04.) The numeric standard is a design standard for BMPs. It does not quantify or limit the pollutants in the effluent. It also does not specify which of the listed BMPs must be employed.

[42] As discussed below, this Board is revising the SUSMPs to delete the application of the design standards to retail gasoline outlets and to locations within or directly adjacent to or discharging directly to environmentally-sensitive areas.

of pollutants and/or runoff following development. It is appropriate that the design standards apply so that BMPs for these categories of development result in the infiltration or treatment of a significant about of the runoff.

Potential Impacts on Ground Water

The petitioners contend that infiltration of runoff may lead to ground water pollution, and that the Regional Water Board did not properly consider such potential impacts. The mitigation standards provide for a waiver where there is a risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than ten feet from the soil surface.[43] The Final SUSMPs also include a discussion on how to use infiltration so that the risk of contamination of groundwater is reduced, and where infiltration is not appropriate.[44]

The Regional Water Board did consider the potential impacts to groundwater from infiltration, and included appropriate limitations and guidance on its use as a BMP. These provisions will ensure adequate protection of groundwater from any adverse impacts due to infiltration.

Contention: The petitioners contend the Regional Water Board failed to show that the SUSMPs as adopted are cost-effective and that the benefits to be obtained outweigh the costs.

Finding: The petitioners refer to the Preamble to the Phase II storm water regulations[45] as the basis for their economic argument. The quoted language, however, does not wholly support the petitioners' contention. The Preamble states that President Clinton's Clean Water Initiative clarifies "that the maximum extent practicable standard should be applied in a site-

[43] Final SUSMP, page 14.
[44] *Id.*, at page 15.
[45] 64 Federal Register 68722 and following. These regulations do not apply to the permit, but the general language on MEP is relevant to EPA's interpretation of the standard.

specific, flexible manner, taking into account cost considerations as well as water quality effects."[46] It is clear that cost should be considered in determining MEP; this does not mean that the Regional Water Board must demonstrate that the water quality benefits outweigh the economic costs.

While the standard of MEP is not defined in the storm water regulations or the Clean Water Act, the term has been defined in other federal rules. Probably the most comparable law that uses the term is the Superfund legislation, or CERCLA, at section 121(b). The legislative history of CERCLA indicates that the relevant factors, to determine whether MEP is met in choosing solutions and treatment technologies, include technical feasibility, cost, and state and public acceptance.[47] Another example of a definition of MEP is found in a regulation adopted by the Department of Transportation for onshore oil pipelines. MEP is defined as to "the limits of available technology and the practical and technical limits on a pipeline operator . . . ."[48]

These definitions focus mostly on technical feasibility, but cost is also a relevant factor. There must be a serious attempt to comply, and practical solutions may not be lightly rejected. If, from the list of BMPs, a permittee chooses only a few of the least expensive methods, it is likely that MEP has not been met. On the other hand, if a permittee employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. Thus while cost is a factor, the Regional Water Board is not required to perform a cost-benefit analysis.

---

[46] 64 Federal Register 68722, 68732 (December 8, 1999).
[47] 132 Cong. Rec. H 9561 (Oct. 8, 1986).

In reviewing the record, it is apparent that the Regional Water Board did evaluate the cost of the SUSMPs. While the petitioners claim there is no evidence in the record to show the SUSMPs are necessary and cost effective, the opposite is true. The record is replete with documentation of costs of pilot mitigation projects, studies from similar programs in other states, and research studies. The Regional Water Board complied with the requirement to consider cost.

The Regional Water Board found that the cost to include BMPs that will meet the mitigation criteria will be one to two percent of the total development cost. This amount appears reasonable, especially in light of the amount of impervious surface already in Los Angeles County and the impacts on impaired water bodies. In considering the cost of compliance, it is also important to consider the costs of impairment. The beach closures in the Los Angeles region, well documented in the evidence, have reached critical proportions. These beach closures clearly have a financial impact on the area, and should be positively affected by the SUSMPs.

We do note that there could be further cost savings for developers if the permittees develop a regional solution for the problem. We recommend that the cities and the County, along with other interested agencies, work to develop regional solutions so that individual dischargers are not forced to create numerous small-scale projects. While the SUSMPs are an appropriate means of requiring mitigation of storm water discharges, we also encourage innovative regional approaches.[49]

Contention: The petitioners have raised contentions regarding details of the SUSMPs, including the amount of time allowed for inclusion of SUSMPs in local ordinances, and their application to both "discretionary" and "non-discretionary" projects. In addition, during the

---

[48] 49 CFR section 194.5.

hearing certain ambiguities in the wording of the Final SUSMPs became apparent, including the provisions regarding redevelopment and environmentally-sensitive areas. In this portion of the Order we address these issues and also the application of the design standards to retail gasoline outlets (RGOs) and the waiver funding requirements.

Finding: The testimony at the hearing in this matter revealed that there are specific provisions of the SUSMPs that create confusion as to the types of development projects subject to the mitigation design standards. The petitioners also contend that application of the standards to specific types of development either is unreasonable or is inconsistent with the terms of the permit. The specific requirements are discussed below.

Retail Gasoline Outlets

Petitioner WSPA contends that RGOs should be excluded from the SUSMPs. Its petition raised the same general contentions as the other petitioners, but at the hearing WSPA presented evidence specific to RGOs. In particular, WSPA raised questions about the propriety of applying the design standards for BMPs to RGOs. In considering this issue, we conclude that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. Moreover, in light of the small size of many RGOs and the proximity to underground tanks, treatment may not always be feasible, or safe. The mandatory BMPs that are included in the SUSMPs may be adequate to achieve MEP at RGOs, but the Regional Water Board should add additional mandatory BMPs, such as use of dry cleanup methods (e.g. sweeping) for removal of litter and debris, use of rags and absorbents for leaks and spills, restricting the practice of washing down hard surfaces unless the wash water is collected and disposed of properly, annual training of employees on proper spill cleanup and waste disposal

[49] We note that the SUSMPs as written do not in any way preclude the development of regional solutions approved by the Regional Water Board as a means to comply with the BMP and design standard requirements.

methods, and the inclusion of BMPs to address trash receptacle areas and air/water supply areas.[50] We conclude that because RGOs are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment, they should not be subject to the BMP design standards at this time, and recommend that the Regional Water Board undertake further consideration of a threshold relative to size of the RGO, number of fueling nozzles, or some other relevant factor. This Order should not be construed to preclude inclusion of RGOs in the SUSMP design standards, with proper justification, when the permit is reissued.

Redevelopment Projects

The SUSMPs were written to apply to new development and to some types of redevelopment in nine categories of projects. The definition of "redevelopment" reflected the intent of the Regional Water Board to define the scope of redevelopment projects subject to the requirements. That definition[51], however, was somewhat confusing, and it was apparent from testimony at the hearing that the parties had different understandings of the scope of redevelopment subject to the SUSMPs. In their post-hearing briefs, the various parties appeared to agree on the actual intent of the Regional Water Board in including redevelopment in the SUSMPs. This intent was to include redevelopment that adds or creates at least 5,000 square feet of impervious surface to the original development and, where the addition constitutes less

[50] These BMPs are from a list of BMPs in a publication of the California Storm Water Quality Task Force. (Best Management Practice Guide – Retail Gasoline Outlets. March 1997.) This publication includes BMPs in addition to those listed in the SUSMPs. All BMPs recommended in this publication should be mandated.

[51] The SUSMPs state: "Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

than 50 percent of the original development, to limit the application of the BMP design standards to the addition.

While some parties requested further requirements for development, it appears that the Regional Water Board's original intent was relatively simple to apply and results in a fair and appropriate application of the SUSMPs' requirements to redevelopment. Therefore, we will revise the definition in the SUSMPs accordingly.

Environmentally-Sensitive Areas

The permit required that the SUSMPs address at least seven development categories.[52] The final SUSMPs added two more categories: parking lots of 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff; and location within or directly adjacent to an environmentally-sensitive area (ESA). The petitioners contend that the addition of ESAs was inappropriate because the permit refers only to "development categories"[53] and ESA is a location category.

Whether or not the Regional Water Board went beyond the permit's terms in including this category, we find a fundamental problem with the language of the SUSMPs regarding ESAs. All of the other categories are relatively simple to apply because they describe the types of development that fall within the category. For instance, the threshold for a commercial development is 100,000 square feet. If the development is smaller, it is not subject to the SUSMPs. But for developments within ESAs, the SUSMPs contain no threshold. This absence led to speculation by the petitioners that something as small as a new patio on a home in an ESA would make the SUSMPs applicable. The Regional Water Board, at the hearing and in its post-

[52] The categories listed in the permit are: single-family hill residences, 100,000 square-foot commercial developments, automotive repair shops, retail gasoline outlets, restaurants, home subdivisions with 10 to 99 housing units, and home subdivisions with 100 or more housing units. Permit, Part 2, III.A.1.c.
[53] *Id.*

hearing brief, conceded that there should be some threshold. While the Regional Water Board did recommend a specific threshold, we believe that it is inappropriate for this Board to add a threshold that has not been fully discussed by all interested persons.

While it may be appropriate to include more stringent controls for developments in ESAs, we also note that such developments are already subject to extensive regulation under other regulatory programs. Moreover, in light of the permit language limiting the SUSMPs to development categories, ESAs are not an appropriate category within the SUSMPs. The Regional Water Board may choose to consider the issue further when it reissues the permit.

Discretionary and Non-Discretionary, or Ministerial, Projects

The petitioners contend that the SUSMPs should apply only to projects that are considered "discretionary" within the meaning of California Environmental Quality Act (CEQA).[54] They argue that the inclusion of non-discretionary, or ministerial, projects is inconsistent with the terms of the permit.

The permit provisions on development projects do refer to "discretionary" projects in several places. The permittees are directed to develop a checklist for determining priority and exempt projects.[55] Priority projects are defined as development and redevelopment projects requiring discretionary approval, which may have a potential significant effect on storm water quality.[56] The permittees are also required to develop a BMP list.[57] In developing the SUSMPs, the permittees are required to incorporate appropriate elements of the BMP list.[58] Next, the permittees must develop a program on planning control measures for priority projects (which are limited to projects requiring discretionary approval), consistent with the list of BMPs and the

[54] Public Resources Code section 21000 *et seq.*
[55] Permit, Part 2, III.A.1.a.
[56] *Id.*
[57] Permit, Part 2, III.A.1.b.

SUSMPs.[59] The permit further states that, in order to assure compliance with these requirements, the permittees must develop guidelines on preparing CEQA documents that link mitigation conditions to "local discretionary project approvals."[60]

Taken as a whole, the provisions of the permit appear to link the development requirements for SUSMPs to developments that receive discretionary approval by local governments, as defined in CEQA. The SUSMPs are an implementation tool for the permit and must be consistent with the permit. While the limitation of the SUSMPs to discretionary projects may not be sufficiently broad for an effective storm water control program, the Regional Water Board acted inappropriately in expanding the SUSMPs to include non-discretionary projects. The Regional Water Board may consider expanding the development controls beyond CEQA discretionary projects when it reissues the permit. But at this time, the SUSMPs must be revised so that they are limited to development projects requiring discretionary approval within the meaning of CEQA.[61]

Waiver Funding Requirement

Where a waiver is granted from the design standard requirements, the Final SUSMPs provide that the permittee must require the project proponent to transfer the cost savings to a storm water mitigation fund. The fund is to be operated by a public agency or a non-profit entity, to promote regional or alternative solutions for storm water pollution in the same storm watershed. The petitioners contend that the funding requirement will create an additional administrative burden.

---

[58] Permit, Part 2, III.A.1.c.
[59] Permit, Part 2, III.a.2.
[60] Permit, Part 2, III.a.3.b.
[61] We note that the Final SUSMPs already include a definition of "discretionary project" consistent with the definition in the CEQA guidelines. Final SUSMPs at page 4 of 25; Title 14, California Code of Regulations, section 15357. Apparently this definition was inadvertently retained after the Regional Water Board decided to expand the SUSMPs beyond discretionary projects.

The concept of a mitigation fund or "bank" is a positive idea for obtaining regional solutions to storm water runoff. As a long-term strategy, municipal storm water dischargers should work to establish regional mitigation facilities, which may be more cost-effective and more technically effective than mitigation structures at individual developments. But at this point there are not sufficient resources in place to require all permittees to establish such funds or to find appropriate non-profit organizations. Before mandating funding, preliminary questions should be answered, including who will manage the fund, what types of projects it will be used for, what entities can legally operate such funds, and how permittees will determine the amount of the assessments. It would be appropriate for the County to consider developing a program with the appropriate flood control agency, or as a model for the separate cities to develop. There may be suitable agencies to administer such funds, but the development of programs may take some time. The Regional Water Board should consider adopting such a program when it reissues the permit, after consultation with the appropriate local agencies.

III. CONCLUSIONS

Based on the discussion above, the Board concludes that:

1. The Regional Water Board complied with the procedural requirements of the permit, including the Administrative Review Process, in approving the Final SUSMPs.
2. The Regional Water Board was authorized to revise the SUSMPs by including more stringent requirements than the permittees had proposed.
3. The Regional Water Board complied with did not violate the Administrative Procedure Act, CEQA, or the Constitutional provisions on state mandates. The petitioners' due process rights have been protected
4. The Regional Water Board considered the costs of the SUSMPs, and acted reasonably in requiring these controls in light of the expected benefits to water quality.

5. The Final SUSMPs reflect a reasonable interpretation of development controls that achieve reduction of pollutants in storm water discharges to the maximum extent practicable.
6. The SUSMPs include adequate protections of groundwater quality from any impacts from infiltration.
7. The SUSMPs will be revised to clarify the intent of the Regional Water Board and to make them consistent with the permit. Specifically, retail gasoline outlets should not be subject to the BMP design standards because they are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment. Redevelopment projects should be subject to the SUSMPs only if they result in creation or addition of 5,000 square feet of impervious surfaces. Environmentally-sensitive areas should not be listed as a category in the SUSMPs. The SUSMPs should only apply to discretionary projects. The requirement for funding by project proponents who receive waivers should be deleted. The SUSMPs will be amended as shown in the attachment to this Order.
8. In light of the revisions of the SUSMPs made by this Order, and to allow the permittees adequate time to adopt implementing ordinances, the deadline for adopting ordinances will be revised to January 15, 2001, and the effective date of the Final SUSMPs will be revised to February 15, 2001.

IV. ORDER

IT IS HEREBY ORDERED that the Standard Urban Storm Water Mitigation Plans for Los Angeles County and Cities in Los Angeles County is revised consistent with the amendments attached hereto. In all other respects the petitions are dismissed.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on October 5, 2000.

AMENDMENTS TO SUSMPS

[These amendments are to the Final SUSMP, as published March 8, 2000]

Page 3 of 25

First full paragraph:

All **discretionary development and redevelopment** projects that fall into one of ~~seven~~ **the following** categories are ~~identified in the Los Angeles County MS4 Permit as requiring~~ **subject to these** SUSMPs. These categories are:

- Single-family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units
- **Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff**

Second full paragraph:

~~The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:~~

- ~~Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and~~
- ~~Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff~~

Fourth full paragraph:

Permittees shall amend codes, if necessary, not later than ~~September 8, 2000~~ **January 15, 2001**, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than ~~October 8, 2000~~ **February 15, 2001**.

Page 4 of 25

Delete definition of "Environmentally Sensitive Area"

Revise Definition of "Redevelopment":

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces ~~or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure~~. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routing maintenance activity; and land disturbing activities related with structural or impervious surfaces. **Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to these SUSMPs, the Design Standards apply only to the addition, and not to the entire development.**

In the matter of THE PETITION OF THE CITIES OF BELLFLOWER, ET AL., THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001])
SWRCB/OCC File Nos. A-1280, A-1280(a), and A-1280(b)

BACKGROUND

The Los Angeles Regional Board (Regional Board) adopted a municipal storm water Permit (Permit) for the cities and portions of Los Angeles County within the Region on June 18, 1990 (Order No 90-079). The Permit was reissued on July 15, 1996 (Order No. 96-054).

The specific portions of the Permit that are pertinent to the petition are sections 2.III.A.1.a, 2.III.A.1.b and 2.III.A.1.c. These sections are based on the federal regulation at 40CFR122.26(d)(2)(iv)(A)(2). It requires Permittees to implement management programs, including a comprehensive planning process to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program is to be based on structural and source control measures including a comprehensive master plan to develop, implement, and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment.

The program, referred to as a Standard Urban Storm Water Mitigation Plan (SUSMP), was to be developed in two parts. The first part under the Permit section 2.III.A.1.b. was to be a menu of BMPs that included site planning practices, post-construction BMPs, and redevelopment and infill practices. The second part, under section 2.III.A.1.c. of the Permit, was to be the actual SUSMP, which outlined how the BMPs were to be implemented and the projects to which they were to be applied. On April 22, 1999, the Regional Board approved the BMP menu and guidelines that the Permittees submitted in compliance with Permit section 2.III.A.1.b. This approval was contained in Regional Board Order No. 99-03. At that time, the Board indicated that rather than leaving approval of the SUSMP to the Executive Officer, as specified in the Permit, it wanted to review the SUSMP, which was to be submitted in response to section 2.III.A.1.c.

The Permittees submitted the SUSMP for Regional Board Executive Officer approval on July 22, 1999. The SUSMP applied the approved BMPs to the categories of development listed in 2.III.A.1.c. A joint workshop was held on August 10, 1999 to evaluate the

language in the SUSMP with the Permittees and Regional Board staff. A revised SUSMP was submitted by the dischargers on August 12, 1999. The Regional Board discussed the SUSMP at the September 16, 1999 meeting. Comments were received from municipalities, environmental groups, businesses, environmental consultants, and the building industry. The issue was continued to allow the Regional Board Executive Officer additional time to fully consider the issues and hold discussions with all of the interested parties.

On December 7, 1999, Regional Board staff released a revised SUSMP, which used most of the language of the SUSMP submitted by the Permittees. The SUSMP, as revised by the Regional Board, added a numeric design standard for the BMPs and added two new categories of designated priority planning projects; (1) projects located adjacent to or discharging to environmentally sensitive areas, and (2) parking lots with 25 or more spaces. Of these two new requirements, only the category of parking lots was not addressed in the Permit. While environmentally sensitive areas was not one of the categories listed in 2.III.A.1.c, it was referred to as a consideration to be used for all projects in 2.III.A.1.a.

The Regional Board conducted a nine-hour hearing on January 26, 2000 and directed the Executive Officer to make changes to the proposed SUSMP and to issue a final version of them. The Regional Board Executive Officer issued the final Board SUSMP on March 8, 2000. The major difference between the draft SUSMP and the revised SUSMP was the deletion of some exemptions, especially an exemption for rooftop runoff. On February 25, 2000, a group of the cities filed a petition with the State Board requesting administrative review, challenging the actions of the Regional Board and the actions of the Regional Board Executive Officer in issuing the SUSMP.

ISSUES AND ANALYSIS

1. Is a numeric design standard for infiltration or treatment appropriate? Is the 0.75-inch standard appropriate? Should it be substituted with a different numeric standard, including potentially different numbers for different areas? If there were a range of numbers, how would that be implemented?

One of the principle differences between the SUSMP proposed by the Permittees and the Regional Board SUSMP is the addition of a numeric design standard. This design standard can be considered a technology based effluent limitation that sets the standard for MEP. USEPA's guidance manual for Part 2 MS4 Permit applications specifically encourages "design criteria and performance standards" for post construction control measures for storm water discharges. If there were no standard specified, the SUSMP would be much harder for the cities to implement. Cities that implemented a more stringent standard could be at a disadvantage with the development community in relationship with neighboring cities who had a less stringent requirement. Developers would argue with the cities over how much of an effort they had to make and environmental advocates could bring suit against a city or developer if there was any

increase in either flow or pollutant loading from a development, arguing that all runoff must be captured. A design standard levels the playing field and offers the regulatory certainty that cities are seeking.

The language for the design standard in the SUSMP is:

"Post-construction Structural or Treatment Control BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency."

The SUSMP does not provide a single standard that must be met. It gives four different methods for determining the required sizing. The methods would provide different sizing criteria depending on the location of the project. The basic philosophy behind all of the methods is that most storms are small and that most runoff is generated by smaller storms and most pollutants are carried by smaller storms. If one graphs the probability of a rainfall event a curve is generated where there is a steep part of the graph representing the smaller quantity events and a flat part of the graph that represents the larger, less frequent storms. In order to maximize the return on an investment in a storm water structure, one would size the structure to capture the quantity of water in the storms on the steep part of the graph and let the greater quantity of water generated by the large storms on the flat part of the graph bypass the system. To achieve the maximum efficiency, one would design the system to capture the size storm that was found at the point where the graph

flattened out. This is a range of values, since the graph defines a curve and not an angle. As described by a graph shown in the testimony by Dr. Xavier Swammikanu at an evidentiory hearing on this appeal conducted on June 7 and 8, 2000, these data, when plotted for the Los Angeles area generally begins to flatten at the 75th percentile and shows the maximum flattening at the 85th percentile 24 hour rainfall event. This corresponds to an average range of 0.6"-0.75" of rainfall, although the numbers are higher, as much as 1.2" in the coastal areas. Using average numbers for the Los Angeles area, sizing for a 0.6" storm would represent the most minimal effort, and sizing for a 0.75" storm would represent the most efficient sizing criteria.

Four different sizing methods are given. The first method requires the cities to determine what the 85th percentile storm is based on their local rainfall data. The second method requires cities to determine the volume equivalent to 80% volume treatment. The third method allows the cities to use the region wide average of 0.75". Finally, a fourth method allows cities to require sizing for a pollutant loading equivalent to that achieved by the 85th percentile 24-hour runoff event. All of these methods are considered equivalent by the Regional Board staff (testimony of Dr. Xavier Swammikanu).

It would be possible to use the 85th percentile as a stand alone standard without allowing the cities to use 0.75 inches as a standard. This would result in varying standards throughout the area with the coastal cities having a standard as high as 1.2 inches. Using this standard would make the SUSMP harder to implement and would leave the cities open to lawsuit as parties argued about the numbers that were chosen. It would also make some cities more attractive to development than neighboring cities. Having a single number as a baseline standard makes the SUSMP more feasible to implement.

In comparison to the standards adopted by other jurisdictions nationwide, this standard is conservative. Maryland, Florida and Washington all require capture of the 90th percentile or better. This corresponds to between 1" and 1.3". In these states, the standard applies to all development, rather than just the nine categories covered by the Los Angeles SUSMP.

2. Are the BMP requirements cost effective?

It is important in considering this issue to determine the alternatives to implementation of the BMP programs. There are three alternatives. One is to do nothing. The second is for the developer to implement the SUSMP on a project by project basis, and the third alternative is for the cities to implement large-scale treatment controls to handle the increased runoff and pollutants. The first alternative is unacceptable under the storm water regulations. This is clearly a requirement of the Permit. The third alternative would require the cities to build large facilities to treat the increased flow from these newly developed areas. The experience of the cities such as Sacramento and San Francisco that have combined sanitary and storm water systems has shown that it is impractical to treat all of the storm water. The cities have already expressed in numerous forums that the cost of the third alternative is prohibitive.

The second alternative spreads the cost between the cities and the developer. In general, the developer will pay for the cost of building the structure, and pass that cost onto the end user. The maintenance of the structure will either fall to the cities or be passed to the owner. The Regional Board staff worked with the City of Los Angeles to determine the actual cost of a structure including maintenance. They found that, in general, the cost of the structures with the first five years of maintenance was less than one percent of the total project cost. As experience is gained with these requirements, it is possible that costs will then drop. However, one of the largest components of the cost is the price of the land and that is unlikely to go down. It is probable that on many of the projects the structures can be built into landscaping or recreational amenities.

It is impossible to say if this will increase the price of low-income housing. There are too many factors in the pricing of housing. If the structures can be part of the landscaping or used for recreation, they can actually be amenities that improve the quality of life by providing more green space.

3. Does implementation of the SUSMP potentially cause problems related to infiltration and ground water contamination?

The SUSMP requires that BMPs be implemented to mitigate, defined as infiltrate or treat, storm water runoff. In most areas, infiltration of runoff is practical, and even beneficial. Infiltration of storm water runoff is an important source of potable water in the Los Angeles area. There are large spreading grounds in the San Fernando and San Gabriel Valleys to facilitate infiltration.

There are also parts of the Los Angeles area in which it is infeasible to infiltrate storm water. These include areas in which infiltration would compromise the stability of the soils, areas where the ground water is close enough to the surface that the pollutants would not be removed before the infiltration reached the water table and areas where the subsurface soils are contaminated and infiltration through those soils will carry the pollutants to the ground water. If any of these conditions are present, the developer has the option to treat the storm water runoff and discharge it to the storm drain system.

In the rare instance where all structural or treatment control BMPs have been considered and rejected as infeasible, the SUSMP provides a waiver. The waiver can be provided in cases where "all other structural or treatment control BMPs have been considered and rejected as infeasible. Recognized situations of impracticability include, (i) extreme limitations of space for treatment on a redevelopment project, (ii) unfavorable or unstable soil conditions at a site to attempt infiltration, and (iii) risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately petitioned by the permittee and submitted to the Regional Board for consideration." This waiver should be comprehensive enough that it will cover all legitimate cases where the SUSMP cannot be applied. The waiver can be approved by the Regional Board, or delegated to

the Executive Officer for approval on a case by case basis where a blanket waiver cannot be applied.

4. Is the definition of redevelopment too inclusive?

The SUSMP defines redevelopment to be "on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces."

The SUSMP definition of redevelopment causes problems when it is applied to single family homes and small facilities such as restaurants, gas stations and automotive repair shops. The problem is particularly acute in "environmentally sensitive areas", where it can be applied to every remodel project, thus triggering the need to implement the SUSMP with every project.

The parts of the definition that are most problematic are "the making of improvements to fifty percent or more of the existing structure" and "replacement of impervious surface that is not part of a routine maintenance activity". The first section can be interpreted to mean that if the interior of a structure is remodeled, with no work being done on the outside, that the SUSMP requirement is triggered. The second part has been interpreted to mean that replacement of a roof or fence would trigger the requirement. Presumably, this is based on the idea that if you replace a roof, it is not "part of a routine maintenance activity". This seems like an extreme interpretation. Replacement of a roof or an interior remodel, with no increase in the footprint of a structure should not trigger the requirement. The exception to this would be in the category of 100,000 Square Foot Commercial Developments. While reroofing the structure should not trigger the requirement, a remodel that affected 50% or more of either the interior or exterior of the structure is more problematic. A remodel of that size would be an enormous investment and the intent would be to dramatically increase use of the structure. While they may not increase the size of the parking facilities, it is certainly the intent to increase the use of those facilities and thereby increase the amount of pollutants deposited.

5. Should location, such as environmentally sensitive areas, be a factor in determining the application of the SUSMP? If so, what specific types of projects should be included?

Environmentally sensitive areas are defined in the SUSMP as "an area designated as an Area of Special Biological Significance by the State Water Resources Control Board (*Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (1994) and amendments) or an area designated as an Area of Ecological Significance by the County of Los *Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional*

Planning (1976) and amendments) or an area designated as a significant natural area by the California Resources Agency. Refer to Table 3 for a listing."

Part 2.III.A.1.a requires that the post construction requirements consider location of the project with respect to designated environmentally sensitive areas as one of the overarching principles. The SUSMP requirement moves this from a basic principle to a category. The designated environmentally sensitive areas are areas that have been deemed to warrant special consideration. It is not unreasonable to apply the SUSMP to all construction in these areas, particularly with a change in the definition of redevelopment.

CONCLUSION

The SUSMP, as issued by the Regional Board, is a reasonable attempt to implement the requirements under 40CFR122.26(d)(2)(iv)(A)(2). The design standard is conservative, technically defensible and provides a level regulatory playing field. The cost of the BMPs is appropriate, especially in comparison to the alternative of large-scale treatment plants. While it is possible that infiltration of storm water could potentially cause problems with soil stability or ground water contamination, the language in the SUSMP has alternatives to infiltration that should prevent this. The definition of redevelopment should be rewritten to remove remodeling or repair work that does not change the size of the structure. It is appropriate to require implementation to all construction in designated environmentally sensitive areas, as these are areas that require special consideration.

SUBJECT: STATE WATER BOARD ORDER WQ 2000-11: SUSMP

On October 5, 2000, the State Water Resources Control Board (State Water Board) adopted a precedential decision concerning the use of Standard Urban Storm Water Mitigation Plans (SUSMPs) in municipal storm water permits. (Order WQ 2000-11; hereafter referred to as "the Order.") The Order arose from the municipal storm water permit in the Los Angeles region. As a precedential decision, the State Water Board has recognized that the decision includes significant legal or policy determinations that are likely to recur. (Gov. Code §11425.60.) The Regional Water Quality Control Board (Regional Water Board) orders must be consistent with applicable portions of the State Water Board's precedential decisions.

In the Order, the State Water Board considered SUSMPs related to new development and redevelopment. The SUSMPs include a list of best management practices (BMPs) for specific development categories, and a numeric design standard for structural or treatment control BMPs. The numeric design standard created objective and measurable criteria for the amount of runoff that must be treated or infiltrated by BMPs. The purpose of the SUSMPs is to control runoff both during and after construction.

Several of the conclusions reached in the Order are likely to recur, and future municipal storm water permits must be consistent with the principles set forth therein.[1] Pursuant to the Clean Water Act, municipal storm water permits must require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP). The Order finds that the provisions in the SUSMPs, as revised in the Order, constitute MEP. The Order also discusses areas where the Regional Water Boards may exercise more discretion.

[1] The Order considered a Phase I storm water permit, applicable to urban areas with populations of 100,000 and greater. The State Water Board will soon embark on Phase II, which will include municipal permits for smaller municipalities. The Order did not address Phase II requirements, which may be different than Phase I requirements.

1. The Order finds that the design standard in the SUSMPs, which essentially requires that 85 percent of the runoff from specified categories of development be infiltrated or treated, reflects MEP. It is conceivable that the specific design standard could vary depending on such factors as rainfall and soil characteristics.

2. The Order determined that SUSMPs appropriately applied to the following categories of development: single-family hillside residences, 100,000 square foot commercial developments, automotive repair shops, restaurants, home subdivisions with 10 to 99 housing units, home subdivisions with 100 or more housing units, and parking lots with 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff. Redevelopment projects that are within one of these categories are included if the redevelopment adds or creates at least 5,000 square feet of impervious surface to the original developments; if the addition constitutes less than 50 percent of the original development, the design standard only applies to the addition. The Order approved a waiver from compliance with the design standard where there is a risk of groundwater contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface.

3. The Order allows broader discretion by the Regional Water Boards to decide whether to include additional types of development in future SUSMPs. These areas for potential future inclusion in SUSMPs include retail gasoline outlets, ministerial projects (only discretionary projects are included in the approved SUSMPs), and projects in environmentally sensitive areas. If Boards include these types of developments in future permits, the Order explains the types of evidence and findings that are necessary.

4. The Order encourages regional solutions. The Order endorses establishment of a mitigation fund or "bank" that could be funded by developers who obtain waivers from the design standards. The Order explains that such a funding mechanism must be developed after consultation with appropriate local agencies.

The SUSMPs as developed by the Los Angeles Regional Water Board resulted from a requirement in a municipal storm water permit to draft and submit a proposal. The Regional Water Board then made revisions to the SUSMPs, and the State Water Board made further revisions prior to approving the SUSMPs. In light of the specificity and detail in the Order, Regional Water Boards should simply incorporate SUSMP requirements for new development and redevelopment into new municipal permits, rather than adopting a process of submittal, review and revision of proposals. In adopting SUSMPs in permits, the requirements should be substantially similar to the SUSMPs approved in the Order. If, for example, the Regional Water Board determines that a different design standard than 85 percent of the runoff is appropriate, the permit findings should explain how the alternative design standard is generally equivalent to the standards approved in the Order, and why the alternative standard is appropriate to the area. The

general principles of the Order—that design standards for BMPs for new development and redevelopment are required—must be implemented.

IMPORTANT NOTICE

Before you rely on the information in this book, please be sure you have the latest edition and are aware that some changes in statutes, guidelines, or case law may have gone into effect since the date of publication. The book, moreover, provides general information about the law. Readers should consult their own attorneys before relying on the representations found herein.

The Book at a Glance

CHAPTER I

Introduction

The Legislature enacted the California Environmental Quality Act (Pub. Resources Code, § 21000 et seq.) ("CEQA"),[1] in 1970, one year after Congress enacted its predecessor statute, the National Environmental Policy Act (42 U.S.C. § 4321 et seq.) ("NEPA"). Like the federal act, CEQA was conceived primarily as a means to require public agency decisionmakers to document and consider the environmental implications of their actions. (See Pub. Resources Code, §§ 21000, 21001; *Friends of Mammoth v. Board of Supervisors* (1972) 8 Cal.3d 247, 254–256 [104 Cal.Rptr. 761]; *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68, 73–75 [118 Cal.Rptr. 34] ("*No Oil I*"); *San Francisco Ecology Center v. City and County of San Francisco* (1st Dist. 1975)[2] 48 Cal.App.3d 584, 589–591 [122 Cal.Rptr. 100]; *Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, 112 [65 Cal.Rptr.2d 580] ("*Mountain Lion Foundation*"); Selmi, *The Judicial Development of the California Environmental Quality Act* (1984) 18 U.C. Davis L.Rev. 197, 202.)

CEQA = California Environmental Quality Act
NEPA = National Environmental Policy Act

CEQA applies to all "governmental agencies at all levels" in California, including "local agencies," "regional agencies," and "state agencies, boards, and commissions." (Pub. Resources Code, §§ 21000, subd. (g), 21001, subds.

CEQA applies to all governmental agencies at all levels in California including local agencies, regional agencies, and state agencies, boards, and commissions.

1. The full text of all of the statutes that together comprise CEQA are included verbatim, updated as of January 1999, as Appendix III to this book.
2. Contrary to the normal practice in the California courts, all citations herein to published opinions of the California Court of Appeal will, for the reader's benefit, refer to the particular district of that court issuing the decision. There are six appellate districts in California.

   The First District consists of the following counties: San Francisco, Marin, Sonoma, Napa, Solano, Lake, Mendocino, Humboldt, Del Norte, Contra Costa, Alameda, and San Mateo. The Second District includes San Luis Obispo, Santa Barbara, Ventura, and Los Angeles Counties. The Third District consists of Siskiyou, Modoc, Trinity, Shasta, Lassen, Tehama, Plumas, Colusa, Glenn, Butte, Sierra, Sutter, Yuba, Nevada, Yolo, Placer, Sacramento, El Dorado, San Joaquin, Amador, Calaveras, Alpine, and Mono Counties. The Fourth District includes Inyo, San Bernardino, Riverside, Orange, San Diego, and Imperial Counties. The Fifth District consists of Stanislaus, Tuolumne, Merced, Mariposa, Madera, Fresno, Kings, Tulare, and Kern Counties. The Sixth District includes Santa Clara, Santa Cruz, Monterey, and San Benito Counties.

(f), (g); CEQA Guidelines, §§ 15002, subd. (b), 15020, 15367, 15368, 15379, 15383.)[3] The Legislature, however, has chosen not to subject its own proposals for legislation to environmental review. (CEQA Guidelines, § 15378, subd. (b)(1).)

Unlike NEPA, CEQA has not been characterized as merely a procedural statute.

Unlike NEPA, CEQA has not been characterized as merely a "procedural" statute. (See *Vermont Yankee Nuclear Power Corporation v. Natural Resources Defense Council* (1978) 435 U.S. 519, 558 [98 S.Ct. 1197]; *Stryker's Bay Neighborhood Council, Inc. v. Karlen* (1980) 444 U.S. 223, 227–228 [100 S.Ct. 497]; see also *Robertson v. Methow Valley Citizens Council* (1989) 490 U.S. 332, 350 [109 S.Ct. 1835].) Rather, CEQA contains a "substantive mandate" that public

3. The "CEQA Guidelines" can be found in title 14 of the California Code of Regulations, commencing with section 15000. Appendix V of this book includes the full text of the Guidelines, along with "Discussions" explaining their content, issued by the California Resources Agency to help agencies and the public interpret the statutes. These helpful Discussions are not found in the official version of the CEQA Guidelines found in the standard copy of Title 14 of the California Code of Regulations published by Barclays and found in most libraries.

The most recent version of the CEQA Guidelines is available on the Internet at: http://ceres.ca.gov/topic/env_law/ceqa/guidelines/. The Guidelines are found within a website full of very valuable information about CEQA and related topics, including full copies of the CEQA statutes, all of the leading CEQA decisions published by the California Supreme Court and California Courts of Appeal, and Technical Advice Documents issued by the Governor's Office of Planning and Research ("OPR"). The specific Internet address providing direct access to all of these materials, as well as a search engine for finding information within the Guidelines, statutes, and cases, is http://www.ceres.ca.gov/ceqa/index.html. Before relying on statutes or Guidelines as found on the website, readers should check the dates provided next to those resources to determine whether they are current. Furthermore, readers who have previously "bookmarked" the website (Netscape) or saved it as a "favorite" (Internet Explorer) should be careful to contact the website again (i.e., "refresh" the "hit") to ensure access to the most recently updated information within the website.

OPR = Office of Planning and Research

Throughout this book, all references to CEQA Guidelines sections and Discussions, except where otherwise noted, reflect the numbering found in the most recent edition, finalized in late October 1998. Prior to 1986, earlier versions of the Guidelines, which are discussed in many of the older court cases described in this book, were numbered differently, and were substantively different in minor respects, particularly in the extent of the Discussions. Guidelines revisions issued in May 1997 and October 1998 also made changes in the numbering of a few sections and subdivisions within those sections. For the benefit of the reader, Appendix IV of this book contains two conversion tables that allow readers to translate the new numbers into the old, and vice versa. The first table shows changes made in the 1986 edition of the Guidelines. The second table shows new numbering created in either the 1997 revisions or those made near the end of 1998. The authors suggest that readers consult these tables if a court case discussed herein cites authority that, after checking, does not seem quite correct.

In past years, the Guidelines, along with the CEQA statutes, could be obtained from the State of California in a document entitled, "CEQA: California Environmental Quality Act—Statute and Guidelines," which was updated periodically. In light of the ease of access to these materials through the Resources Agency's CEQA Internet site, the authors do not know whether the written publication will be updated in the future as often as has been the case in the past. Readers interested in obtaining a copy of the most recent version of that document should therefore call the Department of General Services at (916) 574-2200 to see whether any such available compilation of the statute and Guidelines is up-to-date. Previous editions of the document could be purchased by contacting the Publications Section of the California Department of General Services, P.O. Box 1015, North Highlands, CA 95660. Orders could not be made by phone, with interested persons simply mailing a check, money order, or purchase order for $18, which included postage and handling. Checks were to be made out to the State of California. Orders were to specify both the title of the document and stock number, which, for the 1997 version, was 7540-931-1022-0. The authors of this book do not know whether the same rules and prices apply to attempts to obtain a version of the statutes and Guidelines post-dating 1997. Before purchasing a printed set of CEQA and the Guidelines from the Department of General Services (if available), cost-conscious readers without home or work Internet access or printing capability should explore the option of paying a commercial entity, such as a copying service, to print a copy of the CEQA statutes and Guidelines from the Internet sources identified above.

agencies refrain from approving projects with significant environmental effects if "there are feasible alternatives or mitigation measures" that can substantially lessen or avoid those effects. (*Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, 134 [65 Cal.Rptr.2d 580] ("*Mountain Lion Foundation*"); Pub. Resources Code, § 21002.) "CEQA compels government first to identify the [significant] environmental effects of projects, and then to mitigate those adverse effects through the imposition of feasible mitigation measures or through the selection of feasible alternatives." (*Sierra Club v. State Board of Forestry* (1994) 7 Cal.4th 1215, 1233 [32 Cal.Rptr.2d 19].) Stated another way, "CEQA contains substantive provisions with which agencies must comply. The most important of these is the provision requiring public agencies to deny approval of a project with significant adverse effects when feasible alternatives or feasible mitigation measures can substantially lessen such effects." (*Sierra Club v. Gilroy City Council* (6th Dist. 1990) 222 Cal.App.3d 30, 41 [271 Cal.Rptr. 393]; see also CEQA Guidelines, §§ 15002, subd. (a)(3), 15021, subds. (a)(2), (c), 15041, subd. (a), 15063, subd. (c)(2), 15091, subd. (a), 15093, 15096, subd. (g), 15126, subds. (c), (d), 15364, 15370; *Citizens for Quality Growth v. City of Mount Shasta* (3d Dist. 1988) 198 Cal.App.3d 433, 440–441 [243 Cal.Rptr. 727].)

CEQA contains a substantive mandate that public agencies refrain from approving projects with significant environmental effects if there are feasible alternatives or mitigation measures that can substantially lessen or avoid those effects.

In the nearly 30 years since the enactment of CEQA, the environmental review process has also become a means by which the public interacts with decisionmakers in developing policies affecting the environment. Thus, the California Supreme Court has stated that the CEQA process "'protects not only the environment but also informed self-government.'" (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564 [276 Cal.Rptr. 410] ("*Goleta II*"); see also *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376, 392 [253 Cal.Rptr. 426] ("*Laurel Heights I*"); *Laurel Heights Improvement Association of San Francisco, Inc. v. Regents of the University of California* (1993) 6 Cal.4th 1112, 1123 [26 Cal.Rptr.2d 231] ("*Laurel Heights II*"); *Sierra Club v. State Board of Forestry*, *supra*, 7 Cal.4th at p. 1229.) For example, for projects requiring the preparation of environmental impact reports ("EIRs") or documents the functional equivalent thereof, informed self-government is protected by the requirement that an agency respond in writing to significant environmental points raised during the project review process. That requirement "ensures that members of the [governmental decisionmaking body] will fully consider the information necessary to render decisions that intelligently take into account the environmental consequences. It also promotes the policy of citizen input underlying CEQA." (*Mountain Lion Foundation*, *supra*, 16 Cal.4th at p. 133 (internal citations omitted); Pub. Resources Code, §§ 21080.5, subd. (d)(2)(D), 21091, subd. (d)(2); CEQA Guidelines, § 15088.)

EIR = Environmental impact report

The requirement that a government agency respond in writing to significant environmental points raised in comments in a draft EIR ensures that the agency will fully consider the information necessary to render decisions that intelligently take into account the environmental consequences of a project.

For more information about CEQA, see the following publications: OPR's Technical Advice Series;[4] Bass, Herson, and Bogdan, CEQA Deskbook

4. According to OPR, the CEQA Technical Advice Series "is intended to offer CEQA practitioners, particularly at the local level, concise information about some aspect of the California Environmental Quality Act. This series of occasional papers is part of OPR's public education and training program for planners, developers, and others." (Governor's Office of Planning and Research, Focusing on Master EIRs, CEQA Technical Advice Series (3d ed. 1997) p. 2.) The advisories are "not intended to amend or replace the regulations represented by the *Guidelines*." (*Id.* at p. 3 (italics added).) These advisories are available on the Internet at http://ceres.ca.gov/ceqa/more/tas/.

(1999 ed.);[5] and Kostka and Zischke, Practice Under the California Environmental Quality Act (1993, 1999).[6] On the general subject of land use law in California, see Fulton, Guide to California Planning (2d ed. 1999); Curtin, Curtin's California Land Use and Planning Law (19th ed. 1999);[7] Longtin, Longtin's California Land Use (2d ed. 1987, 1999 supp.);[8] and Manaster and Selmi, eds., California Environmental Law and Land Use Practice (1999), especially chapters 20–23, Bass and Herson, The California Environmental Quality Act.[9] For a series of articles addressing the various perceived benefits and detriments of CEQA as of the spring of 1993, see 2 Land Use Forum 95 et seq. (Cont.Ed.Bar Spring 1993).[10] A 1995 report by the Environmental Law Section of the State Bar of California entitled, "The California Environmental Quality Act: Assessment and Recommendations," can be found on the Internet at: http://www.calbar.org/2sec/3env/3envtoc.htm. A 1997 report by the Legislative Analyst's Office entitled, "CEQA: Making It Work Better," can be found on the Internet at: http://www.lao.ca.gov/ceqa_397.html.

Appendix VI to this book is an article written in October 1998 by Wilson Administration Resources Agency General Counsel Maureen Gorsen entitled, "The New and Improved CEQA Guidelines Revisions: Important Guidance for Controversial Issues." Her article explains how the Wilson Administration, in updating the CEQA Guidelines in 1998, intentionally responded to criticisms of CEQA voiced by entities such as the CEQA Working Group of the Bay Area Economic Forum, the Environmental Law Section of the State Bar, the California Policy Seminar of the University of California at Berkeley, the Association of Environmental Professionals, and other interested organizations. The authors of this book have included Ms. Gorsen's article as an appendix because it constitutes a valuable statement of the intent behind many of the new Guidelines provisions.

A. Procedural Devices of Environmental Review

Probably the best known aspect of CEQA is its requirement that public agencies prepare an EIR whenever the approval of a proposed project may cause significant adverse effects on the environment.

Probably the best known aspect of CEQA is its requirement that public agencies prepare an environmental impact report whenever the "approval" of a proposed "project" may cause "significant [adverse] effects [or 'impacts'] on the environment." (See Pub. Resources Code, §§ 21002.1, 21061, 21100, 21151; CEQA Guidelines, §§ 15080–15096, 15120–15132, 15160–15170, 15358, 15362, 15382.) The courts, in fact, have repeatedly stated that "[i]n many respects, the EIR is the heart of CEQA." (*County of Inyo v. Yorty* (3d Dist. 1973) 32 Cal.App. 3d 795, 810 [108 Cal.Rptr. 377]; see also *Laurel Heights Improvement Association*

5. This book is available from Solano Press, P.O. Box 773, Point Arena, CA 95468, (800) 931-9373 or through the Solano Press website: http://www.solano.com.
6. This book is published by the "Continuing Education of the Bar" Program of the California State Bar. Information on how to order the book can be obtained by calling (800) 232-3444 (or, outside California, (800) 642-8000).
7. The books by Fulton and Curtin are also available from Solano Press, P.O. Box 773, Point Arena, CA 95468, (800) 931-9373.
8. Longtin's California Land Use can be obtained from Local Government Publications, P.O. Box 10087, Berkeley, CA 94707. Orders can be placed over the phone by calling (800) 345-0899.
9. This multi-volume treatise can be obtained from Matthew Bender & Company, (800) 833-9844.
10. Questions about how to comply with CEQA can be directed to the Governor's Office of Planning and Research at (916) 445-0613, or to the Office of Permit Assistance ("OPA") within the California Trade and Commerce Agency at (916) 322-4245.

OPA = Office of Permit Assistance

theory. The court reasoned that the original landfill had never been subject to environmental review, and the practical effect of the regional board's order was to authorize disposal of an additional 3.4 million tons of municipal waste in an unlined landfill. (*Id.* at pp. 1188–1191.)

Whether a particular activity constitutes a project is a question of law as to which a reviewing court owes no deference to the judgment of a respondent agency.

Whether a particular activity constitutes a project is a question of law as to which a reviewing court owes no deference to the judgment of a respondent agency. (*Fullerton, supra*, 32 Cal.3d at p. 795; *Kaufman, supra*, 9 Cal.App.4th at p. 470; *City of South Gate v. Los Angeles Unified School District* (2d Dist. 1986) 184 Cal.App.3d 1416, 1422 [229 Cal.Rptr. 568].) Moreover, a reviewing court's decision as to whether an activity is a "project" should not have to be based on an initial study or other environmental document. As one court observed:

> The existence of a project cannot depend on the outcome of the inquiry which the act contemplates only after the existence of a project is established.
>
> (*Simi Valley, supra*, 51 Cal.App.3d at p. 663.)

For a partial list of actions that have been deemed not to constitute a "project" under CEQA, see section IV(E)(2), *infra*.

B. CEQA Applies to *Discretionary* Projects

CEQA applies to discretionary projects, but not to projects that are purely ministerial.

CEQA applies to "discretionary projects." CEQA does not apply to projects that are purely "ministerial." (Pub. Resources Code, § 21080, subd. (a); CEQA Guidelines, § 15268.)

A "discretionary project" is one that "requires the exercise of judgment or deliberation when the public agency or body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations." (CEQA Guidelines, § 15357; see also *id.*, § 15002, subd. (i); *Johnson v. State of California* (1969) 69 Cal.2d 782 [73 Cal.Rptr. 240]; *Prentiss v. City of South Pasadena* (2d Dist. 1993) 15 Cal.App.4th 85, 90–91 [18 Cal.Rptr.2d 641] ("*Prentiss*"); *Miller v. City of Hermosa Beach* (2d Dist. 1993) 13 Cal.App.4th 1118, 1139 [17 Cal.Rptr.2d 408] ("*Miller*"); *Friends of Westwood, Inc. v. City of Los Angeles* (2d Dist. 1987) 191 Cal.App.3d 259, 271–273 [235 Cal.Rptr. 788] ("*Friends of Westwood*"); *Natural Resources Defense Council, Inc. v. Arcata National Corporation* (1st Dist. 1976) 59 Cal.App.3d 959, 969–970 [131 Cal.Rptr. 172] ("*Natural Resources Defense Council*"); *Day v. City of Glendale* (2d Dist. 1975) 51 Cal.App.3d 817, 822 [124 Cal.Rptr. 569].)

"Ministerial projects," on the other hand, "involve little or no personal judgment by the public official as to the wisdom or manner of carrying out the project. The public official merely applies the law to the facts as presented but uses no special discretion or judgment in reaching a decision. A ministerial decision involves only the use of fixed standards or objective measurements, and the public official cannot use personal, subjective judgment in deciding whether or how the project should be carried out." (CEQA Guidelines, § 15369; see also *id.*, § 15268, subd. (b).)

Projects that possess both ministerial and discretionary attributes are treated as being discretionary.

Projects that possess both ministerial and discretionary attributes are treated as being discretionary. (CEQA Guidelines, § 15268, subd. (d); *Miller, supra*, 13 Cal.App.4th at p. 1139; *Friends of Westwood, supra*, 191 Cal.App.3d at pp. 270–271; *Citizens for Non-Toxic Pest Control v. California Department of Food and Agriculture*

(1st Dist. 1986) 187 Cal.App.3d 1575, 1583 [232 Cal.Rptr. 729]; *Environmental Law Fund v. City of Watsonville* (1st Dist. 1981) 124 Cal.App.3d 711 [177 Cal. Rptr. 542]; *San Diego Trust and Savings Bank v. Friends of Gill* (4th Dist. 1981) 121 Cal.App.3d 203 [174 Cal.Rptr. 784] ("*San Diego Trust*"); *Natural Resources Defense Council, supra*, 59 Cal.App.3d at p. 970; *Day v. City of Glendale* (2d Dist. 1975) 51 Cal.App.3d 817, 823–824 [124 Cal.Rptr. 569] ("*Day*"); cf. *Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, 119 [65 Cal.Rptr.2d 580] ("*Mountain Lion Foundation*") ("the Legislature intended CEQA to apply to discretionary projects, even when the agency's discretion to fully comply with CEQA is constrained by the substantive laws governing its actions").) "[D]oubt whether a project is ministerial or discretionary should be resolved in favor of the latter characterization." (*Friends of Westwood, supra*, 191 Cal.App.3d at p. 271, quoting *People v. Department of Housing and Community Development (Ramey)* (3d Dist. 1975) 45 Cal.App.3d 185, 194 [119 Cal.Rptr. 266] ("*Ramey*").)

The Legislature intended CEQA to apply to discretionary projects, even when the agency's discretion to fully comply with CEQA is constrained by the substantive laws governing its actions.

One Court of Appeal decision indicates that, even where a government approval involves virtually no discretion, CEQA review may be required if the approval "is the only point at which the environmental impact of the project may be publicly considered...." (*Day, supra*, 51 Cal.App.3d at p. 824 (issuance of grading permit was the only chance for CEQA review in process by which ridge would be cut and canyons filled to facilitate highway construction).)[4]

"The statutory distinction between discretionary and purely ministerial projects implicitly recognizes that unless a public agency can shape the project in a way that would respond to concerns raised in an EIR, or its functional equivalent, environmental review would be a meaningless exercise." (*Mountain Lion Foundation, supra*, 16 Cal.4th at p. 117.) In *Mountain Lion Foundation*, petitioners challenged the decision of the Fish and Game Commission ("Commission") to remove the Mojave ground squirrel from the Commission's list of threatened species. (*Ibid.*) Amicus curiae argued that the California Endangered Species Act ("CESA") exempts the Commission's delisting decision from the requirements of CEQA because, under CESA, such a decision is a nondiscretionary biological determination. (*Ibid.*) Fish and Game Code section 2070 requires the Commission to list or delist a species "if it finds, upon the receipt of sufficient scientific information..., that the action is warranted." Nonetheless, said the Supreme Court, "this standard is not so fixed and objective as to eliminate the need for judgment and deliberation on the Commission's part." (16 Cal.4th at p. 118.) The Supreme Court found delisting decisions to be "truly discretionary" based on: (1) statutory language stating that the Commission shall "consider" a petition; (2) regulations stating that a species "may" be delisted; (3) the Commission's own findings stating that the Commission must "consider... weigh and evaluate" the scientific evidence introduced in connection with a proposed delisting; and (4) the fact that, in this case, the Commission declined to follow the recommendation of the Department of Fish and Game not to delist the species. (*Id.* at p. 118.)

CESA = California Endangered Species Act

According to the CEQA Guidelines, the issuance of building permits is presumed to be ministerial in the absence of local ordinance provisions creating

4. The quotation set forth above may be dicta. The Court of Appeal found that the respondent city's grading ordinance was of a "mixed ministerial-discretionary" character, because the factors to be considered in issuing the permit "require[d] the exercise of judgment, deliberation, and decision by the city engineer." (51 Cal.App.3d at p. 823.)

Issuance of building permits is presumed to be ministerial in the absence of local ordinance provisions creating decision-making discretion.

decisionmaking discretion. (CEQA Guidelines, § 15268, subd. (b)(1); see also *Prentiss, supra*, 15 Cal.App.4th at p. 91.) In practice, no "presumption" (in the sense affecting the burden of proof) exists unless the public entity retains *no* discretion whatsoever in approving an application for a permit. Such an utter lack of discretion exists only where the approving agency retains no discretion to exercise subjective judgment regarding the carrying out of *any* phase of the proposed project, but rather must only determine whether the proposal is consistent with applicable zoning and meets strength requirements based on the application of *fixed* standards and *objective* measurements. (*Friends of Westwood, supra*, 191 Cal.App.3d at pp. 269–271.) Standards are not "fixed" where they embody the earlier exercise of an agency's discretion that can be changed or ignored at the agency's discretion. (*Id.* at p. 278.)

The issuance of building permits is ministerial where the ordinance requiring the permit limits public officials' review to determining whether (a) the zoning allows the structure to be built in the requested location, (b) the structure would meet the strength requirements of the Uniform Building Code, and (c) the applicant has paid his fee. (CEQA Guidelines, § 15369.)

As the principles described above implicitly recognize, the issuance of building permits is not *always* ministerial. In *Friends of Westwood*, the Court of Appeal enjoined construction of a proposed 26-story office tower pending resolution of a lawsuit in which the petitioners argued that the issuance of the building permit for the project was discretionary and thus was subject to CEQA. In rejecting the respondent's argument that the issuance was ministerial, the court described a detailed standard for determining when the issuance of building permits is discretionary.

The court first noted that the distinction between ministerial and discretionary decisions exists under CEQA only because preparing environmental documentation for a purely ministerial project would be futile. Since the approving agency has no discretion to modify such a project, the resulting EIR would be just so much wasted paper. As a matter of property rights, the applicant could demand approval of the project as described in his or her application. (191 Cal. App.3d at pp. 266–268.)

The issuance of a building permit may be discretionary even where issuance is mandatory, as long as the approving agency retains discretion to require substantial changes in building design.

The court then explained that the issuance of a building permit may be discretionary even where issuance is mandatory, as long as the approving agency retains discretion to require "substantial changes" in building design. (*Id.* at p. 269.)

Such discretion may exist where the approving agency can impose "reasonable conditions" based on "professional judgment." (*Id.* at p. 272, citing *Natural Resources Defense Council, supra*, 59 Cal.App.3d at p. 971; see also *Day, supra*, 51 Cal.App.3d at pp. 822–824 (issuance of a grading permit held to be of a "mixed ministerial-discretionary character" because factors to be considered in issuing the permit "require[d] the exercise of judgment, deliberation, and decision").)

Discretion may also exist where the standards guiding decisionmakers are "relatively general," rather than fixed and precise, and where the question of compliance involves "relatively personal decisions addressed to the sound judgment and enlightened choice of the administrator." (*Friends of Westwood, supra*, 191 Cal.App.3d at pp. 271–272, citing *Ramey, supra*, 45 Cal.App.3d at p. 193.) Even the power merely "to delay a project" in order to explore alternatives may

be enough to render an approving agency's decision at least partly discretionary. (*Friends of Westwood, supra*, 191 Cal.App.3d at pp. 272–273, citing *San Diego Trust, supra*, 121 Cal.App.3d at pp. 210–214.)

Even the power merely to delay a project in order to explore alternatives may be enough to render an approving agency's decision at least partly discretionary.

In finding that a building permit for an office tower constituted a discretionary project, the *Friends of Westwood* court also emphasized that city staff had exercised discretion to *waive* certain legal requirements that clearly would have required the exercise of discretion and would thus have triggered the CEQA process. Staff opted not to impose these requirements because the concerns in question had been addressed elsewhere in the overall review process. The court reasoned that CEQA could not be interpreted to effectively give agency staff members the chance to exempt a project simply by waiving requirements that would trigger the statute. (191 Cal.App.3d at pp. 273–278.)

The court cautioned, however, that by no means should all, or even most, building permits be regarded as discretionary decisions. "Run of the mill building permits *are* 'ministerial' actions not requiring compliance with CEQA." (*Id.* at p. 277 (emphasis in original).)

The Friends of Westwood *case raises the question of whether many building permit approvals previously deemed ministerial may come to be regarded as at least partially discretionary.*

Despite the court's cautionary note, however, the *Friends of Westwood* case raises the question of whether many building permit approvals previously deemed ministerial may come to be regarded as at least partially discretionary. Many local agencies exercise considerable judgment in imposing conditions to mitigate noise, air pollution, and traffic impacts. For example, in *Miller, supra*, 13 Cal.App.4th 1118, the Court of Appeal held that a building permit for a hotel project required CEQA compliance because of the amount of discretion the local agency had exercised in attaching conditions to the issuance of the building permit.

The Court of Appeal's opinion in *Miller* recounts the history of the proposed hotel complex over a period spanning almost a decade. Beginning in 1983, the Hermosa Beach City Council had approved the hotel project in a number of forms, but in three separate elections the voters had rejected the various legislative approvals the Council had granted.

In 1989, the City rezoned the hotel project site and the developer submitted a new application for a modified hotel project. City officials noted that the developer's stated goal was "to avoid discretionary approvals requiring environmental assessment," but urged the developer to prepare an addendum to an EIR prepared some years earlier for the project. (*Id.* at p. 1123.) Nevertheless, the City did not require an addendum and in November 1989 issued the applicant an "Approval in Concept" for the hotel project, together with "Conditions of Approval" imposed on the development "to alleviate impacts to surrounding properties." The Conditions of Approval included conditions relating to traffic and circulation, pavement evaluation, excavation and dewatering, sanitary sewer, storm drainage, insurance coverage, associated costs, noise, parking, aesthetics, public safety, and utilities.

Among other things, the City required the developer (1) to obtain a "traffic engineering impact analysis" of vehicle and pedestrian circulation prepared by a licensed traffic engineer; (2) to prevent groundwater from entering the storm drain system during dewatering, or from flowing across the surface of the public beach; (3) to obtain a soil settlement analysis performed by a licensed soils engineer; (4) to monitor the extent of subsidence during and after construction; (5) to provide an engineering analysis of peak capacity flows in the sewer line

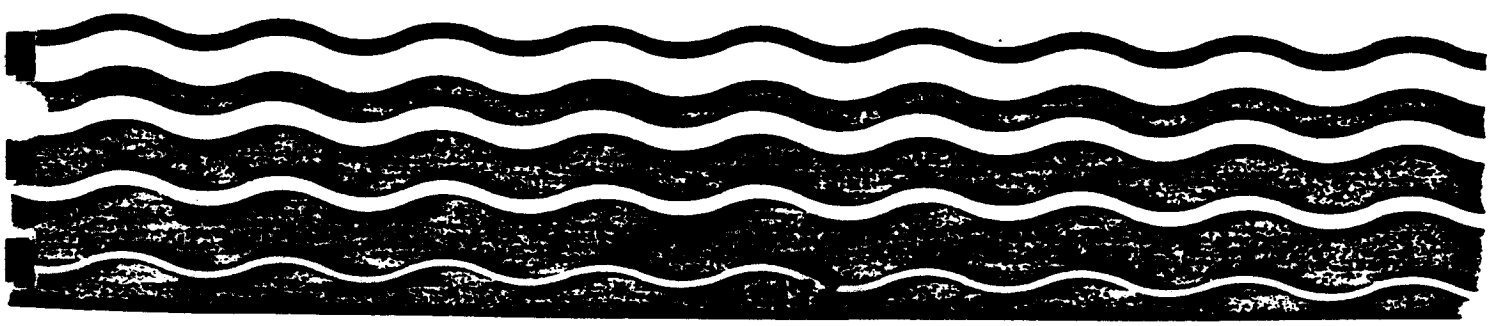
Guidance Manual For The Preparation Of Part 2 Of The NPDES Permit Applications For Discharges From Municipal Separate Storm Sewer Systems

PRE-PRINT

MAZHAR ALI



FOREWORD

This manual provides detailed guidance on the development of Part 2 permit applications for municipal separate storm sewer systems. It provides technical assistance and support for all municipal separate storm sewer systems subject to regulatory requirements under the National Pollutant Discharge Elimination System (NPDES) program for storm water point source discharges. This manual also emphasizes the application of pollution prevention measures and implementation of Best Management Practices (BMPs) to reduce pollutant loadings and improve water quality.

The control of pollution from urban and industrial storm water discharges is critical in maintaining and improving the quality of the Nation's waters. Pollutants in storm water discharges from many sources are largely uncontrolled. The *National Water Quality Inventory, 1990 Report to Congress,* provides a general assessment of water quality based on biennial reports submitted by the States under Section 305(b) of the Clean Water Act (CWA). The report indicates that roughly one third of the impairment in assessed waters is due to storm water runoff.

This document was issued in support of Environmental Protection Agency (EPA) regulations and policy initiatives involving the development and implementation of a national storm water program. This document is Agency guidance only. It does not establish or affect legal rights or obligations. Agency decisions in any particular case will be made applying the laws and regulations on the basis of specific facts when permits are issued or regulations promulgated.

This document will be revised and expanded periodically to reflect additional guidance. Comments from users are welcomed. Send comments to U.S. EPA, Office of Wastewater Enforcement and Compliance, 401 M Street, SW, Mail Code EN-336, Washington, D.C. 20460.

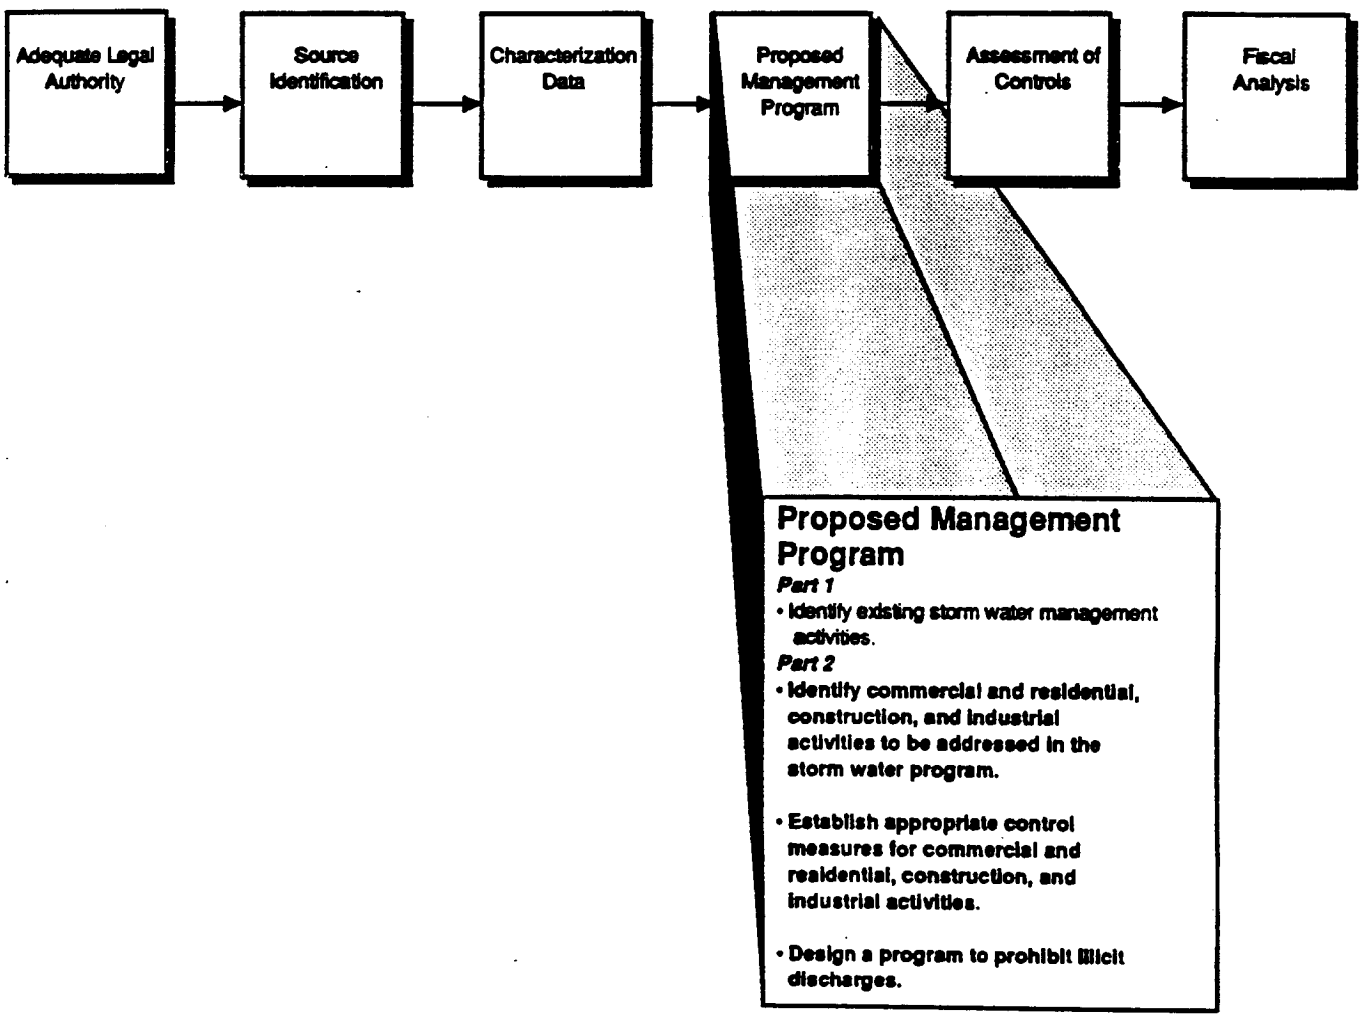
CHAPTER 6
PROPOSED MANAGEMENT PROGRAM



R0003356

6.0 PROPOSED MANAGEMENT PROGRAM

6.1 BACKGROUND

Under the Part 2 application requirements, municipalities must propose site-specific storm water management programs. This is the most important aspect of the permit application. The Part 2 application requirements provide each MS4 with the flexibility to design a program that best suits its site-specific factors and priorities.

The regulations require the applicant to provide a description of the range of control measures considered for implementation during the term of the permit. Applicants must meet all the requirements of the Part 2 application regulation. However, flexibility in developing permit conditions is encouraged by allowing municipalities to emphasize the controls that best apply to their MS4. For example, a municipality that expects significant new development may focus more on requirements for new development and construction, while a municipality that does not expect significant new development may focus more on a program to prohibit illicit discharges or control industrial contributions. In any case, a satisfactory proposed management program will address: management practices; control techniques and systems; design and engineering methods; and other measures to ensure the reduction of pollutants to the "maximum extent practicable (MEP)."

If the municipality proposes a thorough and complete program, the permitting authority is likely to incorporate all or part of the proposed management program into the NPDES storm water permit written for that municipality. Therefore, the proposed programs provide municipalities with the opportunity to have substantial input into their NPDES permit conditions.

This section of the guidance manual describes the minimum information requirements for proposed storm water management programs. Examples of how the program elements should be addressed are provided. These examples illustrate minimum information requirements for the program elements, and occasions when municipalities may opt to go beyond minimum requirements in order to meet the MEP standard.

6.2 SUMMARY OF REGULATORY REQUIREMENTS

The municipality must develop and submit a proposed management program that covers the duration of the permit. The program must integrate the information and actions described in the Part 1 application and portions of the Part 2 application (see Chapters 3, 4, and 5 of this guidance). The regulatory requirements for the proposed management program are in 40 CFR 122.26(d)(2)(iv).

At a minimum, the proposed management program must include:

- A comprehensive planning process that involves both public participation and intergovernmental coordination;
- A description of management practices, control techniques, and system design and engineering methods to reduce the discharge of pollutants to the MEP; and
- A description of staff and equipment available to set up and assess the storm water management program.

Additional provisions under §122.26(d)(2)(iv)(A) require applicants to include:

- Programs to control storm water runoff from commercial and residential areas, construction sites, and industrial

facilities (including waste handling sites), (Section 6.3);

- Identification of structural control measures to be included in these proposed programs, such as detention controls, infiltration controls, and filtration controls that the municipality plans to apply to the activities addressed in its storm water management program (Section 6.4); and

- Programs to detect and remove illicit discharges, and to control and prevent improper disposal into the MS4 of materials such as used oil or seepage from municipal sanitary sewers (Section 6.5).

6.3 PROGRAMS TO CONTROL STORM WATER RUNOFF FROM COMMERCIAL AND RESIDENTIAL AREAS, CONSTRUCTION SITES, AND INDUSTRIAL FACILITIES

A proposed management program must identify the activities or areas that require controls to reduce pollutants in storm water runoff. Specifically, a proposed management program must address storm water runoff from commercial and residential areas (Section 6.3.1), construction sites (Section 6.3.2), and industrial facilities (Section 6.3.3). Also, areas where illicit connections or illegal discharges may occur must be identified (Section 6.5).

In addition to the requirements of the proposed storm water management program, other provisions of the Part 1 and Part 2 applications require information that will help enable the municipality to focus on identifying activities and areas that may need control measures. Examples of these provisions include:

- Identification of sources [Part 1, §122.2(d)(1)(iii)(B)(3)-(4), and Part 2, §122.26(d)(2)(ii)];

- Identification of water bodies that may be adversely affected by storm water runoff [Part 1, §122.26(d)(1)(iv)(C)];

- Organization of sources by watershed [Part 2, §122.26(d)(2)(ii)];

- Description of land use activities [Part 1, §122.26(d)(1)(iii)(B)(2)];

- Results of field screening analysis [Part 1, §122.26(d)(1)(iv)(D)];

- Results of the sampling program [Part 2, §122.26(d)(2)(iii)(A)(3)];

- Estimates of annual pollutant loads and event mean concentrations, and schedules to submit seasonal pollutant loads and event mean concentrations [Part 2, §122.26(d)(2)(iii)(B) and (C)]; and

- Findings from an on-going monitoring program [Part 2, §122.26(d)(2)(iii)(D)].

6.3.1 Commercial and Residential Activities

Under §122.26(d)(2)(iv)(A), applicants must propose structural and source control measures to reduce pollutants from commercial and residential areas.

> **§122.26(d)(2)(iv)(A).** [The proposed management program must include a] description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls.

To ensure that proposed control measures are effective, the applicant should study how storm water runoff from pollutant sources affects the existing municipal system, how the proposed

control measures will enhance the existing system, and what impact the proposed measures will have on receiving waters. The control measures should recognize and emphasize the interaction between pollutant sources and the physical attributes of the municipal system and receiving waters.

Specific commercial and residential activities that must be addressed include maintenance activities and a maintenance schedule for structural controls to reduce pollutants in storm water runoff. This provision is discussed in Section 6.4.2. Other activities to be addressed include:

- Post-construction controls to reduce pollutants in discharges to MS4s resulting from new development and significant redevelopment (Section 6.3.1.1);
- Practices for maintaining and operating public streets, roads, and highways that will reduce the impact on receiving waters from storm water runoff discharges (Section 6.3.1.2);
- Procedures to assure that the impacts on receiving waters from flood management projects are assessed, and that existing structural control devices have been evaluated to determine if retrofit controls are feasible (Section 6.3.1.3);
- A program to monitor pollutants in runoff from operating or closed municipal landfills that identifies priorities and procedures for inspections and establishing and implementing control measures (Section 6.3.1.4); and
- A program to reduce to the maximum extent practicable, pollutants in storm water runoff associated with the application of pesticides, herbicides, and fertilizer (Section 6.3.1.5).

To reduce pollutants in storm water runoff from commercial and residential activities, a proposed management program might include the use of infiltration devices, detention and retention basins, vegetated swales, water quality inlets (which may include oil and water or oil/grit separators), screens, channel stabilization/riparian habitat enhancement efforts, wetland restoration and preservation projects, as well as various source control strategies and other nonstructural control measures.

6.3.1.1 New Development and Significant Redevelopment

Summary of Regulatory Requirement

New development or redevelopment often increases impervious land surfaces, which usually leads to increased pollutant levels in storm water runoff. Chemical and thermal changes in storm water runoff are commonly associated with new development and can adversely affect the quality of receiving waters. In addition, urbanization results in an increase in the volume of storm water discharges.

The Nationwide Urban Runoff Program (NURP) study (EPA, 1983) and more recent investigations indicate that controlling the contribution of pollutants in storm water discharges at the onset of land development is the most cost-effective approach to storm water quality management. Mitigating problems caused by pollutants after they have entered a MS4 is often more expensive and less efficient than preventing or reducing the discharge of pollutants at the source. Therefore, a satisfactory proposed management program will propose structural and nonstructural measures to reduce pollutants in storm water discharges from areas of new development and redevelopment. Examples of such measures are discussed below.

§122.26(d)(2)(iv)(A)(2). [The applicant must include a] description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.

Provisions under §122.26(d)(2)(iv)(A)(2) focus on the reduction of pollutants in storm water runoff after construction in areas where new development or redevelopment is completed. Controls that are required during construction are discussed in Section 6.3.2 of this guidance.

Post-Construction Controls

Proposed storm water management programs should include planning procedures for both during and after construction to implement control measures to ensure that pollution is reduced to the maximum extent practicable in areas of new development and redevelopment. Design criteria and performance standards may be used to assist in meeting this objective.

Further, storm water management program goals should be reviewed during planning processes that guide development to appropriate locations and steer intensive land uses away from sensitive environmental areas. A municipality may, for example, include provisions in the planning process that ensure that all new development in targeted areas or zones provides for a certain percentage of undisturbed area to assist in preserving post-development runoff quality and velocity as similar as possible to pre-development conditions. In its Part 2 application, a municipality should describe how it plans to implement the proposed standards (e.g., through an ordinance requiring approval of storm water management programs, a review and approval process, and adequate enforcement).

The proposed storm water management program should identify and include planning procedures and control measures that will be used in the municipality.

Planning Procedures

Comprehensive planning procedures typically involve incorporation of land use goals and objectives into a plan document or a plan map. These plans are often called Master Plans, Comprehensive Land Use Plans, or Comprehensive Zoning Plans.

Comprehensive or master plans are often non-binding. They provide support and direction to local officials that have the authority to make land use decisions.

While applicants do not need to submit a complete comprehensive or master plan with the Part 2 application, they should detail the planning process employed by the municipality. They must thoroughly describe how the municipality's comprehensive plan is compatible with the storm water regulations. The description should clearly:

- Identify management objectives for streams, wetlands, and other receiving waters;
- Identify areas where urban development is likely to occur and areas that are sensitive to the effects of urbanization. Consideration should be given to receiving waters, topography, soil types, ground water uses and potential impacts, and other relevant factors;
- Describe standards such as design criteria and performance standards for storm water controls for new developments, such as buffer zones,

open space preservation, erosion and sediment controls, etc.;

- Describe other measures to minimize the effects of new development on storm water quality (these may include local code and ordinance requirements); and

- Identify or discuss the site development review process for the evaluation and approval of storm drainage or storm water management programs. Requirements in drainage or storm water management programs can be coordinated with review of other related plans such as those for site grading or landscaping.

There will be great variation among municipalities in their sophistication of land use planning. If the municipality has recently updated its land use plan, it may detail storm water quality issues. In other instances, there may be no policy to include storm water quality considerations in land use decisions. In such cases, the applicant must describe how consideration of those activities that affect storm water quality are to be incorporated into the municipality's comprehensive or master plan and its approval process for construction projects.

Control Measures

Most traditional storm water control measures focus on efficient collection and conveyance of storm water runoff to an offsite location. This approach can increase downstream property damage due to increased storm water runoff quantity and flow velocity. Corrective action often involves expensive public works projects, such as enlarging and reinforcing channels or constructing swales to provide an adequate outfall from affected or damaged areas. The traditional approach has typically involved downstream channel stabilization projects. However, these projects may also result in increased storm water runoff quantity and flow velocity.

Some recent approaches to storm water management include preserving the natural features of a watershed by maintaining vegetative cover and establishing buffer zones and open space or green areas. The benefit of employing this approach is the protection afforded to riparian areas and wetlands, as well as the preservation of a stable watershed. One additional benefit from this approach includes maintaining ground water recharge through infiltration. These approaches to storm water management minimize the impact of erosion, flooding, and other damage to natural drainage features such as streams, wetlands, and lakes. Preservation of natural habitat can be achieved through effective storm water quality control measures. More recent approaches use storm water to:

- Recharge ground water sources with runoff from impervious areas;

- Preserve baseflows of surface water bodies;

- Augment water supplies used for street cleaning and other municipal functions, such as watering public lawns;

- Increase recreational opportunities including swimming, fishing, and boating; and

- Sometimes, augment drinking water supplies if it is treated and in compliance with all applicable drinking water standards.

The municipality should consider storm water controls and structural concerns in planning, zoning, and site or subdivision plan approval. An example of effective structural control is described in Exhibit 6-1. Non-structural control measures are highly recommended for new development. They can be included during the planning, site-selection, and development stages. Examples of non-structural controls include street sweeping, buffer strip preservation, and public education.

Exhibit 6-1
Storm Water Programs in Delaware and Florida

Delaware requirements for on-site measures include water quality ponds with permanent pools. Ponds must be designed to release the equivalent volume of runoff from the first 1/2 inch of runoff from the site over a 24-hour period and have a storage volume designed to accommodate at least 1/2 inch of runoff from the site. Water quality ponds without permanent pools may also be used in Delaware's program. These pools are to be designed to release the first inch of runoff from the site over a 24-hour period.

Developers are instructed to consider infiltration practices only after ponds are eliminated for engineering or hardship reasons. Infiltration structures must be designed to accept at least the first inch of runoff from all streets, roadways, and parking lots. Other practices may be acceptable if they meet the equivalent removal efficiency of 80 percent for suspended solids. More stringent requirements may be established on a case-by-case basis.

The 80 percent removal efficiency for suspended solids that Delaware requires takes into account pollutant settling. The 24-hour detention period allows for substantial settling where most of the pollutant removal occurs. In addition, the requirement that the first inch of runoff be released over a period of no less than 24 hours reduces downstream erosion.

Source: Schueler, 1987.

For significant redevelopment, municipalities can incorporate both structural and nonstructural storm water controls. However, there are generally far more constraints and limitations on the control opportunities available at redevelopment sites. One of the primary constraints is the availability of sufficient open area to accommodate structural controls such as detention ponds. In instances where redevelopment is occurring in densely urbanized areas, storm water runoff volumes may be so large that sufficient storage capacity can not be provided without further compounding problems associated with siting and retrofitting existing storm water conveyance systems. In such cases, the municipality should consider nonstructural control measures such as traffic flow control, the use of porous construction materials for roads and parking lots, revisions to street sweeping or deicing policies, or public education programs.

6.3.1.2 Public Streets, Roads, and Highways

Summary of Regulatory Requirement

Public streets, roads, and highways can be significant sources of pollutants in discharges from MS4s. Therefore, proposed management programs must include a description of practices for operation and maintenance of public streets, roads, and highways, and procedures for reducing the impact of runoff from these areas on receiving waters.

§122.26(d)(2)(iv)(A)(3). [The application must include a] description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities.

185

- Recordkeeping and public notice procedures.

6.3.2 Construction Sites

As specified in §122.26(d)(2)(iv)(D), applicants must describe proposed regulatory programs to reduce pollutants in storm water runoff from construction sites to the MS4.

> §122.26(d)(2)(iv)(D). [The application must include a] description of a program to implement and maintain structural and nonstructural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system.

This part of the proposed management program must address:

- Implementation of BMPs;
- Procedures for reviewing site plans to ensure that they are consistent with local sediment and erosion control plans;
- Inspection of construction sites; and
- Enforcement measures and educational activities for construction site developers and operators.

EPA encourages municipalities to (1) coordinate requirements to reduce pollutants in construction site runoff with management programs to reduce pollutants from new development, and (2) maintain, to the degree possible, pre-construction hydrologic conditions (Section 6.3.1.1). Applicants are encouraged to describe these two proposed management program components together. Implementation of this program component will rely on the establishment and maintenance of both structural and nonstructural BMPs. This requirement extends to all construction activity within the municipality.

All construction sites, regardless of size, must be addressed by the municipality. To begin to identify these sites, the applicant should obtain lists of construction site operators that are covered by general or individual storm water NPDES permits from the NPDES permitting authority. However, construction sites not covered by a storm water discharge permit also need to be addressed by the municipality. The best way to identify these construction sites and implement an effective BMP program to reduce pollutants in their runoff is through the site planning process (see Section 6.3.2.1).

The BMPs envisioned for construction site runoff are generally well established technologies and practices. They rely predominantly on erosion and sediment controls and other measures applicable to construction sites (e.g., control of solid wastes, and prohibitions on discharging concrete truck washing runoff into storm drains). The technologies proposed should be referenced, and a description of when and how the controls will be used should be included. Municipality-specific technical guidance for construction site operators, such as handbooks and inspection checklists, are examples of suitable reference sources. If an applicant chooses to develop such handbooks and checklists, they should be referenced and described in the application.

The major requirements of this program component include:

- Site planning that considers the potential impacts on water quality;
- Nonstructural and structural best management practices;
- Procedures that consider physical site characteristics when identifying priorities for inspection and enforcement; and
- Educational and training measures for construction site operators.

Each of these requirements, and the reasons that they are important elements of a proposed storm water management program, is described in more detail below.

6.3.2.1 Site Planning

Sediment runoff rates from construction sites are typically 10 to 20 times greater than those of agricultural lands, and 1,000 to 2,000 times those of forest lands. Over a short period, construction sites can contribute more sediment to streams than had been deposited over several decades. Runoff from construction sites can also include other pollutants such as phosphorus and nitrogen from fertilizer, pesticides, petroleum derivatives, construction chemicals, and solid wastes.

To address these problems, the proposed management program should describe procedures for site planning that consider potential water quality impacts.

> §122.26(d)(2)(iv)(D)(1). [The program for construction sites must include a] description of procedures for site planning which incorporate consideration of potential water quality impacts.

The objective is for the municipality and the developer to address storm water discharges from construction activity early in the project design process so that potential water quality impacts can be eliminated or minimized and consequences to the aquatic environment assessed. Nonstructural approaches to minimize the generation of runoff from the construction site will also need to be considered. These measures may include phasing development to coincide with seasonal dry periods, minimizing areas that are cleared and graded to only the portion of the site that is necessary for construction, exposing areas for the briefest period possible, and stabilizing and reseeding disturbed areas rapidly after construction activity is completed.

It is often easier and more effective to incorporate storm water quality controls during the site plan review process or earlier. The process typically culminates with the developer of the construction site submitting detailed engineering plans to the municipality for review and approval.

Upon completion of the site plan review stage, the developer and the municipality have invested considerable time and money into the project. If storm water quality issues are considered only after significant detailed engineering has gone into the project, municipal site reviewers may only address minor drainage issues. In recent years, however, many municipalities have developed separate teams of site inspectors to implement erosion and sediment control measures in the field. In these municipalities, site inspectors should be part of the site review team (if they are not already) in order to incorporate their expertise on the appropriate erosion and sediment controls for the given circumstances.

The above discussion reinforces the importance of site planning, as described in the section on site planning for new development (Section 6.3.1). In general, the sooner planners consider storm water quality issues, the better the opportunity for efficient and effective pollutant reduction. In some cases storm water issues should be considered in the conceptual stage of planning (e.g., as a planning or zoning function).

Some municipalities include a final step in the planning process that requires a developer to provide a far greater level of design detail than earlier conceptual design approvals. This step may be required as a condition of the final approval for certain zoning categories. Municipalities with such a step in the development process can consider potential storm water quality issues in detail at this stage. Municipalities that do not currently require such detailed plans should consider adopting this procedure as part of their storm water management program.

6.3.2.2 Nonstructural and Structural BMPs for Construction Activities

This component of the proposed management program should describe requirements for nonstructural and structural BMPs that operators of construction activities that discharge to MS4s must meet.

> §122.26(d)(2)(iv)(D)(2). [The program for construction sites must include a] description of requirements for nonstructural and structural best management practices.

As indicated above, applicants must propose site review and approval procedures that address sediment and erosion controls, storm water management, and other appropriate measures. Approvals should be clearly tied to commitments to implement structural and nonstructural BMPs during the construction process. Appropriate structural and nonstructural control requirements will vary by project. Project type, size, and duration, as well as soil composition, site slope, and proximity to sensitive receiving waters will determine the appropriate structural and nonstructural BMPs. Municipalities should acquire the authority to require operators to install and maintain applicable erosion and sediment control plans. Exhibit 6-2 summarizes common construction-site BMPs.

A description of the local erosion and sediment control law or ordinance is needed to satisfy this program requirement. The description should include information that links the enforcement of the law or ordinance to the legal authority of the applicant, as discussed in Section 3 of this manual.

While many municipalities have erosion and sediment control ordinances in place, their effectiveness is often limited because they are not adequately implemented and enforced. Examples include silt fencing that is not maintained, or excavated soils that are placed directly on top of the silt fencing. Therefore, construction sites covered under NPDES permit regulations must indicate whether they are in compliance with State and local sediment and erosion control plans. Site inspections are expected to be the primary enforcement mechanism by which erosion and sediment controls are maintained.

To ensure that developers are in compliance with erosion and sediment control plans, applicants may wish to consider expanding the use of performance bonds. This approach might depart from a traditional site bonding approach. For example, the size of bonds could be based on the amount of earth disturbed, the slope of the site, changes in grades, soil type, proximity to surface waters, sensitivity of surrounding area, and other relevant factors. In addition, the bond could clearly specify the storm water quality controls that must be included in the development. Appropriate maintenance and site cleanup could be tied to the bond-release process.

6.3.2.3 Site Inspections and Enforcement of Controls For Construction Sites

Storm water BMPs associated with construction activities are highly susceptible to damage due to the intensity of activities commonly associated with construction. Consequently, inspections are crucial to the effective operation of storm water BMPs. Therefore, the proposed management program should describe construction site inspection and enforcement procedures. The procedures should be flexible so that they can be tailored to specific construction activities and physical characteristics of the construction site.

> §122.26(d)(2)(iv)(D)(3). [The program for construction sites must include a] description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.

Source: Modified from WDOE, *Public Review Draft - Stormwater Management Manual for the Puget Sound Basin*, Washington State Department of Ecology, Publication #90-73. June 1991.

Effective inspection and enforcement requires adequate staff, systematic inspection procedures, penalties to deter infractions, and intervention by the municipal authority to correct violations. Enforcement mechanisms, such as the ability to require additional storm water controls, administrative penalties (e.g., stop work orders) and injunctive relief (via citizen suits) also must be described. In addition, the applicant should describe who has the authority to require compliance.

Proposed procedures for inspecting construction sites may include minimum frequencies and an inspector's checklist. For example, the State of Delaware requires a minimum of one inspection every two weeks for sites over 50,000 square feet.

The proposed program should also specify the minimum number of inspectors that will be employed during the permit term and how they will be trained. For example, some erosion and sediment control programs require that certified private inspectors be used. In such case, procedures for inspector training and certification must also be described.

In formulating procedures to identify priorities for inspecting sites and enforcing control measures, applicants are encouraged to begin early in the process (i.e., at the site planning stage, as discussed previously) and continue throughout all ground disturbing activities. Once the nature of the construction activity has been established or perhaps modified during the site plan review process, the physical site constraints can be evaluated so that effective controls can be implemented.

For example, if the controls specified in the site plan prove to be ineffective, or if changes occur that were not anticipated during the planning process, site inspection and enforcement mechanisms can be required to mitigate the potential for pollutants to enter a downstream MS4. In this instance, a perimeter barrier, such as a temporary diversion dike, could be used to divert the concentrated runoff to a pipe slope drain terminating with a level spreader. The spreader would dissipate the erosive velocity of the runoff and release it into an undisturbed area beyond the limits of the clearing and grading at the toe of the slope.

The proximity and sensitivity of the receiving water to which the construction site discharges is an important consideration. For construction sites that discharge to receiving waters that do not support their designated use or other waters of special concern, additional construction site controls are probably warranted and should be strongly considered. These receiving waters are identified in the Part 1 municipal NPDES storm water permit application [§122.26(d)(1)(i)(C)].

6.3.2.4 Educational Measures for Construction Site Operators

Construction site operators often need training and education about the sources, control, and impacts of pollutants in runoff from construction sites (see Virginia, 1988). Therefore, applicants must describe examples of informational materials and activities to be used in education programs.

> §122.26(d)(2)(iv)(D)(4). [The program for construction sites must include a] description of appropriate educational and training measures for construction site operators.

Implementation and enforcement of erosion and sediment controls have historically been major problems even with many programs that may be otherwise exemplary. Therefore, technical information on how to incorporate storm water management with erosion and sediment control and other BMP training courses are recommended for municipal employees and construction site operators. Training on the available alternatives will help operators recognize and correct problems promptly. Tools for such training include videos, workshops, seminars, and demonstrations or field trips.

California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013-1105

Dear Mr. Dickerson:

CITY OF LOS ANGELES ADDITIONAL REVIEW COMMENTS ON THE FIRST DRAFT OF THE 2001 LOS ANGELES COUNTY MUNICIPAL STORM WATER NPDES PERMIT

We are transmitting the attached additional comments on the first draft of the 2001 Los Angeles County Municipal Storm Water National Pollutant Discharge Elimination System Permit. These comments deal with issues that are governed by official policies of the City of Los Angeles and are impacted by the draft Permit.

As we noted when we submitted comments on technical issues on May 16, 2001, any official position of the City of Los Angeles with respect to legislation, rules, regulations or policies proposed to or pending before a local, state, or federal governmental body or agency must first be adopted in the form of a resolution by the City Council with the concurrence of the Mayor. Attached please find the City's position on the draft Permit with supporting documentation.

Once again, the City appreciates that the Regional Board will give due consideration to incorporating the City's comments into the final Permit.

CITY OF LOS ANGELES

INTER-DEPARTMENTAL CORRESPONDENCE

DATE: June 18, 2001

TO: Councilmember Mark Ridley-Thomas, Chair
Environmental Quality and Waste Management Committee

FROM: Ronald F. Deaton
Chief Legislative Analyst

William T. Fujioka, Director
Office of Administrative and Research Services

SUBJECT: POLICY ISSUES RELATED TO THE DRAFT 2001 NATIONAL POLLUTION DISCHARGE ELIMINATION SYSTEM (NPDES) MUNICIPAL STORMWATER PERMIT

BACKGROUND: The Los Angeles Regional Water Quality Control Board (Regional Board) recently issued a draft 2001 NPDES Municipal Stormwater Permit for review and comment. The NPDES permit is reissued every five years and the existing permit expires on July 31, 2001. This permit identifies the waste discharge requirements for municipal storm water and urban runoff discharges within the County of Los Angeles and the incorporated cities (except Long Beach and Santa Clarita). The County of Los Angeles is the principal permittee and the City of Los Angeles and 82 other jurisdictions are co-permittees.

A Council Motion regarding the 2001 NPDES Municipal Stormwater Permit was introduced on May 18, 2001 (CF#01-1020). This motion directed the CLA and OARS to prepare a report for the Environmental Quality and Waste Management Committee on various policy implications of the draft 2001 NPDES permit.

The deadline for the receipt of comments was May 16, 2001. City staff prepared and submitted technical comments to the Regional Board on that date (see attached). There were, however, several substantive policy issues associated with the proposed permit. In light of the new charter, which states that any official position of the City of Los Angeles with respect to pending agency regulations must have first been adopted in the form of a Resolution by the City Council with the concurrence of the Mayor, this report has been prepared.

The Regional Board has issued a schedule that states that there will be two more draft permits; a second draft of the permit will be issued on June 29, 2001 and a final draft will be issued on September 6, 2001. The proposed adoption date by the Regional Board is scheduled for October 25, 2001.

JUN 2 1 2001

2. Programs for industrial/commercial inspections

Proposed Permit - The proposed permit includes language that would require the City to move from educational visits to site inspections and require the City to inspect all industrial/commercial sites under the Regional Board's jurisdiction, in addition to the City's jurisdiction. Additionally, the proposed permit would add categories of industrial and commercial businesses within the City, almost doubling the list from 13,000 to 23,000 businesses. The required inspections would involve a thorough review of the physical structure and layout of the business, as well as a review of their common practices. It is estimated that, depending on the type of business, the new inspections would average two hours, not including expected follow-up visits, which may be necessary for a majority of the businesses.

Current Practice - The existing NPDES permit requires the City to conduct educational site visits, which are typically brief in duration. Staff activities are limited to distributing brochures and other informational handouts.

Impact on City - Staff supports moving from site visits to full inspections of industrial/commercial sites. This will allow the City to thoroughly review industrial/commercial stormwater impacts and begin enforcement actions on violators. Additionally, staff is supportive of increasing the number of industrial/commercial sites that are under the jurisdiction of the permittees. It is estimated that an additional two new inspectors would be necessary to fulfill the new NPDES requirements to inspect industrial/commercial sites under the City's jurisdiction, which would cost $175,081 per year. Additional attorney costs for anticipated legal actions, which are difficult to estimate, may also be necessary. The SPAF anticipated some additional costs associated with the proposed NPDES permit and included $530,000 in the 2001-02 budget (See Table 1).

The proposed permit, however, also assigns the responsibility for industrial/commercial inspections currently under the Regional Board's jurisdiction to the City. The Regional Board receives permit fees from between $250 and $500 from General Industrial Activities Stormwater Permits for their industrial/commercial inspections. Staff strongly opposes the requirements of the draft permit that passes these responsibilities to the City. These responsibilities clearly belong to and should remain with the Regional Board. Staff estimates that an additional four new inspectors, beyond the previously mentioned two inspectors, would be necessary to carry out this requirement, at a cost of $350,000 per year.

Recommended City Position – Support the Regional Board's responsibility for inspections of industrial/commercial sites that are under their General Industrial Activities Stormwater Permit.

3. Standard Urban Storm Water Mitigation Plans (SUSMPs)

Proposed Permit – Include administrative projects in the SUSMP project categories.

Current Practice - on January 25, 2000, the City Council adopted a policy position that endorsed, in concept, the SUSMP requirement for developments as proposed by the Regional

Board. The Regional Board's proposal included discretionary and ministerial (administratively approved) projects. Although the SUSMP requirements ultimately adopted by the State Water Resources Control Board (State Board) for the current NPDES permit apply only to discretionary projects, the Regional Board has the authority to add ministerial projects when the NPDES permit is re-issued. As a result, the draft NPDES permit expands this section to include ministerial projects.

Impact on City - The inclusion of ministerial projects in the draft NPDES permit for SUSMP project categories is estimated to require four additional staff at a cost of $432,779. The Stormwater Pollution Abatement Fund (SPAF) anticipated some additional costs associated with the proposed NPDES permit and included $530,000 in the SPAF 2001-02 budget (see Table 1).

Recommended City Position – Support the requirements for Standard Urban Storm Water Mitigation Plans (SUSMP).

4. **Implement Requirements for Peak Flow Control.**

Proposed Permit – The proposed permit requires all development that drains to soft-bottom channels, including the entire upper Los Angeles River region (the San Fernando Valley), to show that a post-development peak runoff discharge rate does not exceed the pre-development runoff discharge rate.

Current Practice – The current peak flow control requirements are implemented as part of the existing SUSMP requirements imposed through the CEQA review process. This condition is applicable to the SUSMP project categories where developments will result in increased potential for downstream erosion. It is applied to only developments that have site runoff discharge ***directly*** to soft-bottom channels.

Impact on City - Typical peak flow control measures include detention, retention, or infiltration systems. These measures, however, are limited for new developments in the San Fernando Valley, due to the Watermaster's restriction against any infiltration systems. Staff prepared a sample peak flow calculation, assuming the need for detention/retention, which resulted in a system the size of an average swimming pool for a one-acre development. If this example is accurate, the need for additional open spaces for detention, retention and infiltration systems will severely constrain development in the San Fernando Valley.

Recommended City Position – Since this requirement is not defined in detail and may have significant impact, staff recommends the Peak Flow Control requirement be deleted until consensus language is developed.

5. **Small Construction Site Requirements.**

Proposed Permit - The proposed permit states that for construction sites of less than one acre, the proposed permit would require the implementation of structural and non-structural BMPs, as well as site inspections.

Current Practice – Under the current permit, for sites less than two acres of disturbed soil, construction projects are required to implement minimum BMPs, which consist of good housekeeping practices. During routine inspections, City inspectors observe practices for compliance with minimum requirements. There are no inspections specifically conducted to look for storm water compliance.

Impact on City - In essence, this proposed requirement would make *every* project subject to storm water conditions, which would be over 30,000 projects per year in the City of Los Angeles. "Less than one acre" does not have a lower limit and goes significantly beyond the intent of the upcoming federal stormwater regulations. Many projects less than one acre do not cause an adverse impact on water quality. Those that do not cause an adverse impact are not being regulated at the state or federal level and will not be regulated in the immediate future. If a site that is less than one acre does cause an adverse impact on water quality, then current local, state and/or federal ordinances, laws and regulations give the authority for agencies to take enforcement action.

Staff estimates that an additional eight staff would be necessary to conduct this activity at a cost of approximately $809,456. This would increase the stormwater pollution abatement charge by about a dollar a year for residents.

Recommended City Position – Delete the additional requirements on the City to require structural and non-structural BMPs and site inspections on construction sites less than one acre.

6. **Larger Construction Site Requirements.**

Proposed Permit - For construction sites greater than one acre, the proposed permit would require the review and inspection of BMP implementation plans during construction and a Storm Water Pollution Prevention Plan (SWPPP) on site.

Current Practice - Currently, the City is required to inspect construction sites of two acres and above for compliance with a SWPPP. Should violations be discovered on sites between two and five acres, the City conducts follow-up activities. If the construction project site is five acres or over, the City notifies the Regional Board for follow-up activities. The Regional Board is responsible for issuing State General Construction Permits and conducting follow-up activities for sites five acres and above. Beginning in 2003, however, federal regulations will require the Regional Board issue General Construction Permits for sites one acre and above. The issuance of these permits will allow the Regional Board to collect fees for site inspection activities. As the proposed permit is currently written, however, cities will be required to inspect these sites, while the Regional Board collects the fees. It is more appropriate for the Regional Board to begin this activity in 2003 and fund their work through their permit fees.

Impact on the City – It is estimated that the cost to hire an additional two staff to review and inspect BMP implementation plans and SWPPPs would cost approximately $188,339. This would cost the ratepayers an increase of several cents on their Stormwater Pollution Abatement Charge.

EPA

Storm Water Phase II Final Rule

Post-Construction Runoff Control Minimum Control Measure

This fact sheet profiles the Post-Construction Runoff Control minimum control measure, one of six measures that the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program in order to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements for post-construction runoff control and offers some general guidance on how to satisfy those requirements. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

Why Is The Control of Post-Construction Runoff Necessary?

Post-construction storm water management in areas undergoing new development or redevelopment is necessary because runoff from these areas has been shown to significantly effect receiving waterbodies. Many studies indicate that prior planning and design for the minimization of pollutants in post-construction storm water discharges is the most cost-effective approach to storm water quality management.

There are generally two forms of substantial impacts of post-construction runoff. The first is caused by an increase in the type and quantity of pollutants in storm water runoff. As runoff flows over areas altered by development, it picks up harmful sediment and chemicals such as oil and grease, pesticides, heavy metals, and nutrients (e.g., nitrogen and phosphorus). These pollutants often become suspended in runoff and are carried to receiving waters, such as lakes, ponds, and streams. Once deposited, these pollutants can enter the food chain through small aquatic life, eventually entering the tissues of fish and humans. The second kind of post-construction runoff impact occurs by increasing the quantity of water delivered to the waterbody during storms. Increased impervious surfaces interrupt the natural cycle of gradual percolation of water through vegetation and soil. Instead, water is collected from surfaces such as asphalt and concrete and routed to drainage systems where large volumes of runoff quickly flow to the nearest receiving water. The effects of this process include streambank scouring and downstream flooding, which often lead to a loss of aquatic life and damage to property.

What Is Required?

The Phase II Final Rule requires an operator of a regulated small MS4 to develop, implement, and enforce a program to reduce pollutants in post-construction runoff to their MS4 from new development and redevelopment projects that result in the land disturbance of greater than or equal to 1 acre. The small MS4 operator is required to:

- ❑ Develop and implement strategies which include a combination of structural and/or non-structural best management practices (BMPs);
- ❑ Have an ordinance or other regulatory mechanism requiring the implementation of post-construction runoff controls to the extent allowable under State, Tribal or local law.

- ❑ Ensure adequate long-term operation and maintenance of controls;

- ❑ Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure.

What Is Considered a "Redevelopment" Project?

The term "redevelopment" refers to alterations of a property that change the "footprint" of a site or building in such a way that there is a disturbance of equal to or greater than 1 acre of land. The term does not include such activities as exterior remodeling. Because redevelopment projects may have site constraints not found on new development sites, the rule provides flexibility for implementing post-construction controls on redevelopment sites that consider these constraints.

What Are Some Guidelines for Developing and Implementing This Measure?

This section includes some sample non-structural and structural BMPs that could be used to satisfy the requirements of the post-construction runoff control minimum measure. It is important to recognize that many BMPs are climate-specific, and not all BMPs are appropriate in every geographic area. Because the requirements of this measure are closely tied to the requirements of the construction site runoff control minimum measure (see Fact Sheet 2.6), EPA recommends that small MS4 operators develop and implement these two measures in tandem. Sample BMPs follow.

❑ Non-Structural BMPs

- **Planning and Procedures.** Runoff problems can be addressed efficiently with sound planning procedures. Master Plans, Comprehensive Plans, and zoning ordinances can promote improved water quality by guiding the growth of a community away from sensitive areas and by restricting certain types of growth (industrial, for example) to areas that can support it without compromising water quality.

- **Site-Based Local Controls.** These controls can include buffer strip and riparian zone preservation, minimization of disturbance and imperviousness, and maximization of open space.

❑ Structural BMPs

- **Storage Practices.** Storage or detention BMPs control storm water by gathering runoff in wet ponds, dry basins, or multichamber catch basins and slowly releasing it to receiving waters or drainage systems. These practices both control storm water volume and settle out particulates for pollutant removal.

- **Infiltration Practices.** Infiltration BMPs are designed to facilitate the percolation of runoff through the soil to ground water, and, thereby, result in reduced storm water quantity and reduced mobilization of pollutants. Examples include infiltration basins/trenches, dry wells, and porous pavement.

- **Vegetative Practices.** Vegetative BMPs are landscaping features that, with optimal design and good soil conditions, enhance pollutant removal, maintain/improve natural site hydrology, promote healthier habitats, and increase aesthetic appeal. Examples include grassy swales, filter strips, artificial wetlands, and rain gardens.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect needs and characteristics of the operator and the area served by its small MS4. Furthermore, the measurable goals should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following goals:

Target Date	Activity
1 year.....	Strategies developed that include structural and/or non-structural BMPs.
2 years.....	Strategies codified by use of ordinance or other regulatory mechanism.
3 years.....	Reduced percent of new impervious surfaces associated with new development projects.
4 years.....	Improved clarity and reduced sedimentation of local waterbodies.

EPA

Storm Water Phase II Final Rule

Construction Site Runoff Control Minimum Control Measure

This fact sheet profiles the Construction Site Runoff Control minimum control measure, one of six measures that the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements and offers some general guidance on how to satisfy them. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

Why Is The Control of Construction Site Runoff Necessary?

Polluted storm water runoff from construction sites often flows to MS4s and ultimately is discharged into local rivers and streams. Of the pollutants listed in Table 1, sediment is usually the main pollutant of concern. Sediment runoff rates from construction sites are typically 10 to 20 times greater than those of agricultural lands, and 1,000 to 2,000 times greater than those of forest lands. During a short period of time, construction sites can contribute more sediment to streams than can be deposited naturally during several decades. The resulting siltation, and the contribution of other pollutants from construction sites, can cause physical, chemical, and biological harm to our nation's waters. For example, excess sediment can quickly fill rivers and lakes, requiring dredging and destroying aquatic habitats.

Table 1

Pollutants Commonly Discharged From Construction Sites
Sediment
Solid and sanitary wastes
Phosphorous (fertilizer)
Nitrogen (fertilizer)
Pesticides
Oil and grease
Concrete truck washout
Construction chemicals
Construction debris

What Is Required?

The Phase II Final Rule requires an operator of a regulated small MS4 to develop, implement, and enforce a program to reduce pollutants in storm water runoff to their MS4 from construction activities that result in a land disturbance of greater than or equal to one acre. The small MS4 operator is required to:

- ❑ Have an ordinance or other regulatory mechanism requiring the implementation of proper erosion and sediment controls, and controls for other wastes, on applicable construction sites;
- ❑ Have procedures for site plan review of construction plans that consider potential water quality impacts;
- ❑ Have procedures for site inspection and enforcement of control measures;
- ❑ Have sanctions to ensure compliance (established in the ordinance or other regulatory mechanism);

- ❑ Establish procedures for the receipt and consideration of information submitted by the public; and
- ❑ Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Suggested BMPs (i.e., the program actions/activities) and measurable goals are presented below.

What Are Some Guidelines for Developing and Implementing This Measure?

Further explanation and guidance for each component of a regulated small MS4's construction program is provided below.

Regulatory Mechanism

Through the development of an ordinance or other regulatory mechanism, the small MS4 operator must establish a construction program that controls polluted runoff from construction sites with a land disturbance of greater than or equal to one acre. Because there may be limitations on regulatory legal authority, the small MS4 operator is required to satisfy this minimum control measure only to the maximum extent practicable and allowable under State, Tribal, or local law.

Site Plan Review

The small MS4 operator must include in its construction program requirements for the implementation of appropriate BMPs on construction sites to control erosion and sediment and other waste at the site. To determine if a construction site is in compliance with such provisions, the small MS4 operator should review the site plans submitted by the construction site operator before ground is broken.

Site plan review aids in compliance and enforcement efforts since it alerts the small MS4 operator early in the process to the planned use or non-use of proper BMPs and provides a way to track new construction activities. The tracking of sites is useful not only for the small MS4 operator's recordkeeping and reporting purposes, which are required under their NPDES storm water permit (see Fact Sheet 2.9), but also for members of the public interested in ensuring that the sites are in compliance.

Inspections and Penalties

Once construction commences, BMPs should be in place and the small MS4 operator's enforcement activities should begin. To ensure that the BMPs are properly installed, the small MS4 operator is required to develop procedures for site inspection and enforcement of control measures to deter infractions. Procedures could include steps to identify priority sites for inspection and enforcement based on the nature and extent of the construction activity, topography, and the characteristics of soils and receiving water quality. Inspections give the MS4 operator an opportunity to provide additional guidance and education, issue warnings, or assess penalties. To conserve staff resources, one possible option for small MS4 operators is to have these inspections performed by the same inspector that visits the sites to check compliance with health and safety building codes.

Information Submitted by the Public

A final requirement of the small MS4 program for construction activity is the development of procedures for the receipt and consideration of public inquiries, concerns, and information submitted regarding local construction activities. This provision is intended to further reinforce the public participation component of the regulated small MS4 storm water program (see Fact Sheet 2.4) and to recognize the crucial role that the public can play in identifying instances of noncompliance.

The small MS4 operator is required only to *consider* the information submitted, and may not need to follow-up and respond to every complaint or concern. Although some form of enforcement action or reply is not required, the small MS4 operator is required to demonstrate acknowledgment and consideration of the information submitted. A simple tracking process in which submitted public information, both written and verbal, is recorded and then given to the construction site inspector for possible follow-up will suffice.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

Target Date	Activity
1 year.....	Ordinance or other regulatory mechanism in place; procedures for information submitted by the public in place.
2 years.....	Procedures for site inspections implemented; a certain percentage rate of compliance achieved by construction operators.
3 years.....	Maximum compliance with ordinance; improved clarity and reduced sedimentation of local waterbodies.
4 years.....	Increased numbers of sensitive aquatic organisms in local waterbodies.

Are Construction Sites Already Covered Under the NPDES Storm Water Program?

Yes. EPA's Phase I NPDES storm water program requires operators of construction activities that disturb five or more acres to obtain a NPDES construction storm water permit. General permit requirements include the submission of a Notice of Intent and the development of a storm water pollution prevention plan (SWPPP). The SWPPP must include a site description and measures and controls to prevent or minimize pollutants in storm water discharges. The Phase II Final Rule similarly regulates discharges from smaller construction sites disturbing equal to or greater than one acre and less than five acres (see Fact Sheet 3.0 for information on the Phase II construction program).

Even though all construction sites that disturb more than one acre are covered nationally by an NPDES storm water permit, the construction site runoff control minimum measure for the small MS4 program is needed to induce more localized site regulation and enforcement efforts, and to enable operators of regulated small MS4s to more effectively control construction site discharges into their MS4s.

To aid operators of regulated construction sites in their efforts to comply with both local requirements and their NPDES permit, the Phase II Final Rule includes a provision that allows the NPDES permitting authority to reference a "qualifying State, Tribal or local program" in the NPDES general permit for construction. This means that if a construction site is located in an area covered by a qualifying local program, then the construction site operator's compliance with the local program constitutes compliance with their NPDES permit. A regulated small MS4's storm water program for construction could be a "qualifying program" if the MS4 operator requires a SWPPP, in addition to the requirements summarized in this fact sheet.

The ability to reference other programs in the NPDES permit is intended to reduce confusion between overlapping and similar requirements, while still providing for both local and national regulatory coverage of the construction site. The provision allowing NPDES permitting authorities to reference other programs has no impact on, or direct relation to, the small MS4 operator's responsibilities under the construction site runoff control minimum measure profiled here.

Is a Small MS4 Required to Regulate Construction Sites that the Permitting Authority has Waived from the NPDES Construction Program?

No. If the NPDES permitting authority waives requirements for storm water discharges associated with small construction activity (see 122.26(b)(15)(i)), the small MS4 operator is not required to develop, implement, and/or enforce a program to reduce pollutant discharges from such construction sites.

NPDES Storm Water [illegible] Activity Disturbing [illegible] Acres

Under the Storm Water Phase II Final Rule, construction activity disturbing equal to or greater than one acre and less than five acres of land is subject to NPDES permitting requirements. Construction activity disturbing less than one acre requires a permit if it is part of a larger common plan of development or sale disturbing a total of one acre or greater, or is individually designated for permit coverage by the NPDES permitting authority. The NPDES Storm Water Program currently addresses storm water discharges from construction sites disturbing five acres or greater (as well as sites less than five acres if they are part of a larger common plan of development or sale disturbing a total of five acres or greater).

IMPORTANT: Note that permit applications from operators of constructions activities disturbing less than five acres will not be due until 2002/early 2003. Contact your Permitting Authority for the exact date.

Key questions addressed here include:

- What is required of Phase II construction operators under the Final Rule?
- What waivers are available for Phase II construction activity?

- Storm Water Phase II Final Rule: Construction Program Overview (Fact Sheet 3.0)
- Storm Water Phase II Final Rule

What Is Required Of Phase II Construction Operators Under The Final Rule?

The Phase II Final Rule requires, nationally, operators of Phase II construction sites to obtain an NPDES permit and implement best management practices (BMPs) to minimize pollutant runoff. [It is important to note that, locally, these same sites may also be covered by State, Tribal, or local construction runoff control programs.] For the Phase II construction program, EPA has taken an approach similar to the current Phase I approach where the program requirements are not fully defined in the rule but rather in the NPDES storm water permit issued by the NPDES permitting authority. EPA recommends that the NPDES permitting authorities use their existing NPDES storm water general permits for construction as a guide in developing their Phase II construction permits. In doing so, the Phase II requirements will be similar to the following three main requirements of EPA's Construction General Permits:

R0003379

202

- Submission of a Notice of Intent (NOI) that includes general operator and site information, and a certification that the activity will not impact endangered or threatened species. This certification is unique to EPA's NOI and is not a requirement of most NPDES-delegated State's NOIs;
- The development and implementation of a Storm Water Pollution Prevention Plan (SWPPP) with appropriate BMPs to minimize the discharge of pollutants from the site; and
- Submission of a Notice of Termination (NOT) when final stabilization of the site has been achieved as defined in the permit, or storm water runoff is no longer being discharged, or when another operator has assumed control of the site.

What Waivers Are Available for Phase II Construction Activity?

Under the Phase II Final Rule, NPDES permitting authorities have the option of providing a waiver from the requirements to operators of Phase II construction activity who could certify to one of two conditions:

1. Low predicted rainfall potential (i.e., activity occurs during a negligible rainfall period), where the rainfall erosivity factor ("R" in the Revised Universal Soil Loss Equation (RUSLE)) is less than 5 during the period of construction activity. Chapter 2 of the USDA's publication, "Predicting Soil Erosion by Water: A Guide to Conservation Planning with the Revised Universal Soil Loss Equation (RUSLE)", is now available for download here (in Adobe Acrobat format) and contains more information on the R factor. Fact Sheet 3.1 on the "Construction Rainfall Erosivity Waiver" will be availabe soon - see the Fact Sheet series for this and other fact sheets on the Phase II program.

2. A determination that storm water controls are not necessary based on either:

   (A) Total Maximum Daily Load (TMDL) approved or established by EPA that addresses the pollutant(s) of concern for construction activities; or

   (B) For non-impaired waters that do not require TMDLs, an equivalent analysis that determines allocations for small construction sites for the pollutant(s) of concern or that determines that such allocations are not needed to protect water quality based on consideration of existing in-stream concentrations, expected growth in pollutant contributions from all sources, and a margin of safety.

Note: Waivers are *not* available for any construction activity disturbing 5 acres or greater, or less than 5 acres if part of a common plan of development or sale (or if designated for permit coverage by the NPDES permitting authority).

Chapter 2
Regulatory Framework

The structure of urban runoff regulations includes all levels of government. Responsibility for enforcement and oversight of these regulations can be held by federal, state, local, or in some cases regional agencies. Despite this array of programs and regulations, the primary responsibility for developing approaches to solve urban runoff pollution problems generally resides with municipalities. Such pollution problems are considered to be best handled locally because of the site-specific nature of pollution sources and of potential pollution prevention and control activities.

The major direction for prevention and control of urban runoff pollution has come from the federal government through the 1972 Clean Water Act (CWA) and its amendments. Several sections of the Act deal with diffuse source pollution. Additional federal statutes that address urban runoff pollution include the Pollution Prevention Act, the Safe Drinking Water Act (SDWA), and the Coastal Zone Management Act (CZMA).

This chapter discusses the major federal regulations, policies, and programs related to urban runoff pollution prevention and control. Given the national scope of this handbook and the site-specific nature of state, regional, and local regulations, this chapter focuses on regulations and programs at the federal level. Currently, the major federal statutes, regulations, and programs that provide a framework for storm water runoff and NPS pollution prevention and control are:

- Storm Water NPDES Permit Program
- Combined Sewer Overflow Strategy
- Pollution Prevention Act
- Safe Drinking Water Act
- Nonpoint Source Management Program
- Coastal Zone Nonpoint Source Pollution Control
- Clean Lakes Program
- National Estuary Program
- Agricultural Nonpoint Source Programs

This chapter includes a general discussion of each of these statutes, regulations, and programs and of how they relate to urban runoff pollution control at the municipal level. Because of the dynamic, evolving nature of most of these regulations and programs, municipalities must keep up to date on specific schedules and requirements. In addition, local officials need to be familiar with urban runoff pollution prevention and control programs initiated and overseen by state, county, and local entities. These programs might stem from federal regulatory authority but will be more tailored and directly applicable to local issues and needs.

Storm Water NPDES Permit Program

Under Section 402 of the 1972 CWA, point source discharges of pollutants to navigable waters are prohibited unless authorized by an NPDES permit. Initially, the focus of the permit program was on point source discharges of industrial and municipal wastewaters. As controls for point source discharges were implemented, however, it became apparent that to achieve the water quality goals of the CWA, more diffuse sources of pollutants, including urban and agricultural runoff, also would have to be addressed.

In the 1987 amendments to the CWA, Congress introduced new provisions and reauthorized existing programs that address diffuse sources. The development of a workable program to regulate storm water discharges was challenging given the number of individual discharges, the diffuse nature of the sources and related water quality effects, and limited state and federal resources. After extended development and review, EPA promulgated the NPDES storm water regulations in November 1990. These regulations represent the most comprehensive program to date for controlling urban and industrial storm water runoff pollution. The storm water regulations apply to municipal separate storm sewer systems that serve either incorporated populations greater than 100,000 or unincorporated, urbanized populations greater than 100,000 based on the 1980 decennial census. In addition, EPA defined a discharge associated with industrial activity; activities that fall within 11 industrial categories are required to obtain a NPDES storm water permit (U.S. EPA, 1990a).

The 1990 NPDES storm water permit regulations directly affect approximately 200 municipalities and 47 counties across the country, as well as an estimated 125,000 industries and 10,000 construction sites annually. Under this extensive program, affected municipalities and industries must conduct storm water runoff sampling and collect site characterization information for each permit application. The municipal permit application requirements include:

- Proof of the municipality's legal authority to enforce the regulations.
- Characterization of the municipality's storm water runoff through wet-weather sampling.
- Location of illicit storm drain connections and development of a plan to eliminate those connections.
- Description of existing urban runoff control programs and development of a proposed storm water management program.
- Analysis of the municipality's fiscal resources to implement the program.

Once a permit application is filed and a permit issued, both municipalities and industries are required to comply with permit conditions as specified by EPA or the responsible state permitting authority. EPA has developed general permits designed to cover many industrial storm water discharges. These general permits require the elimination of non-storm water discharges from drainage systems and the development of a storm water pollution prevention plan, including:

- Development of a pollution prevention team.
- Description of sources expected to add pollution to runoff.
- Implementation of source control practices, such as:
  - good housekeeping,
  - preventive maintenance,
  - spill prevention and response procedures,
  - equipment inspections,
  - employee training,
  - recording and internal reporting procedures,
  - removal of non-storm water discharges,
  - sediment and erosion control, and
  - management of runoff.
- Implementation of annual site-compliance evaluations.

Most municipalities in the United States have populations under 100,000 and therefore are not currently required to file municipal storm water permit applications. EPA is considering regulations to address storm water runoff pollution from smaller communities (CWA Section 402), which could be required to develop storm water management plans. In addition, existing NPDES regulations allow EPA or a responsible state permitting authority to require permits for any storm water discharges that cause violations of water quality standards.

Combined Sewer Overflow Strategy

Combined sewer overflows (CSOs) are discharges from sewer systems that are designed to carry storm water rainfall and snowmelt runoff, along with sanitary sewage, pretreated industrial wastewater, and a certain quantity of flow from storm and ground-water infiltration. Combined systems were constructed in more than 1,200 municipalities throughout the United States, particularly in the Northeast, East, and Midwest. Combined sewer systems have overflow points designed to discharge wet-weather flows that exceed the carrying capacity of the system (usually designed to carry peak dry-weather flow). Such combined sewer discharges, if not treated before overflowing into receiving waters, can significantly affect water resources and threaten human health.

Many municipalities have begun to address these pollution sources through various means, such as storing and treating the discharges, implementing low-cost BMPs, and replacing combined sewers with separate sanitary and storm sewer systems. Separating combined systems can be a long and relatively expensive process and results in a separate storm drainage system that could eventually require an NPDES permit.

To address CSO discharges, EPA developed a national strategy (Federal Register, 1989), which sets forth three major objectives in NPDES permitting for CSOs:

- To ensure that no CSOs occur during dry-weather flow conditions.
- To bring all wet-weather CSOs into compliance with the technology-based requirements of the CWA and applicable state water quality standards.
- To minimize impacts on water quality, aquatic biota, and human health from wet-weather generated overflows.

To achieve these objectives, recommended strategies include the application of the best conventional pollutant control technology (BCT), or best available technology economically achievable (BAT), based on best professional judgment (BPJ).

The technology-based effluent limitation for CSOs were mandated to include six minimum technologies:

- Proper operation and maintenance

- Maximization of collection system storage
- Pretreatment
- Maximization of flow to treatment plant
- Elimination of dry-weather overflows
- Control of solids and floatables

Following the development of a guidance document for implementing the National CSO Strategy, three more minimum technologies were added to the list:

- CSO inspection, monitoring, and reporting
- Pollution prevention
- Public notification of CSO impacts

EPA, with input from numerous state, municipal, and environmental organizations, released a new Draft CSO Control Policy on January 19, 1993. The final policy will provide guidance to permittees on developing consistent CSO control strategies, and to NPDES permitting authorities on developing permit language and enforcement strategies that will ensure consistent implementation of control strategies.

Pollution Prevention Act

With the passage of the Pollution Prevention Act of 1990, Congress established a national policy that emphasizes pollution prevention over control or treatment. With this policy, Congress defined a pollution prevention hierarchy for all pollution reduction programs:

- Pollution should be prevented or reduced at the source whenever feasible.
- Pollution that cannot be prevented should be recycled in an environmentally safe manner.
- Pollution that cannot be prevented or recycled should be treated in an environmentally safe manner.
- Disposal or other release to the environment should be a last resort and should be conducted in an environmentally safe manner.

As stated in Chapter 1, one goal of this handbook is to integrate pollution prevention into urban runoff pollution control planning. Summarizing the goals of EPA's pollution prevention program, the National Pollution Prevention Strategy serves two basic purposes:

- To provide guidance and direction for incorporating pollution prevention in EPA regulatory and nonregulatory programs.
- To set forth a program that will achieve specific pollution prevention objectives in a reasonable time period.

To address the first objective, EPA is investigating changes to the institutional barriers to pollution prevention within the Agency by:

- Designating special assistants for pollution prevention in each assistant administrator's office.
- Developing incentives and awards for Agency staff who engage in pollution prevention efforts.
- Incorporating prevention into each program office's comprehensive 4-year strategic plans.
- Providing pollution prevention training to Agency staff.
- Supporting technology innovation.
- Including prevention-related activities in the Agency's operating guidance, accountability measures, and regulatory review and development process.

To address the second objective, EPA is targeting high-risk chemicals and seeking to reduce releases of these chemicals through a voluntary program.

This pollution prevention policy was originally developed to address industrial waste issues. Since it also applies to storm water and diffuse source pollution, EPA is now emphasizing pollution prevention at the municipal level in dealing with urban runoff pollution. Municipalities are encouraged to employ techniques and policies that reduce the amount of pollutants available for transport in urban runoff. Municipalities can implement activities and use management practices that are consistent with EPA's pollution prevention policies. Such activities include public education; household hazardous waste collection; location and elimination of illicit connections to separate storm systems; reduction of roadway sanding and salting; and reduction of pesticide, herbicide, and fertilizer use. Such programs, which are discussed in later chapters, can reduce the availability of pollutants for washoff.

Safe Drinking Water Act

The Surface Water Treatment Rule (SWTR) of the SDWA outlines requirements for watershed protection. Municipalities that use surface water for drinking-water supplies are required by EPA or the approved state agency to develop a watershed protection plan for such surface waters (AWWA, 1990). Municipalities are required to:

- Develop a watershed description, including:
  - the watershed's geographic location and physical features;
  - the location of major components of the water system in the watershed;
  - annual precipitation patterns, streamflow characteristics, and other hydrology information;

- agreements and delineation of land use and ownership.

- Identify the watershed characteristics and activities detrimental to water quality, such as:
  - the effects of precipitation, terrain, soil types, and land cover;
  - the effects of animal population;
  - point sources of contamination;
  - nonpoint sources of contamination, such as road construction, pesticides, logging, grazing animals, and recreational activities.
- Control detrimental activities by implementing appropriate control practices.
- Conduct ongoing routine and specific monitoring.

Under the SDWA, watershed control programs also must:

- Minimize potential contamination by *Giardia* cysts and viruses in the water source.
- Characterize the watershed hydrology and land ownership.
- Identify watershed characteristics and activities that threaten or harm source water quality.
- Monitor activities that threaten or harm source water quality.

These watershed control programs are designed to protect surface drinking water supplies from urban runoff and NPS pollutants, and to reduce the need for subsequent water treatment.

Nonpoint Source Management Program

A 1975 federal program designed to address NPS pollution, called the 208 program, did not lead to significant implementation. A more recent program, initiated under the 1987 CWA amendments, is one of the few federal programs that specifically addresses and provides funding for NPS control. Through this program under CWA Section 319, states must submit a Nonpoint Source Assessment Report which:

- Identifies navigable waters that do not meet applicable water quality standards.
- Identifies categories of nonpoint sources that add significant pollution to the waters not meeting water quality standards.
- Describes the process for identifying BMPs to address the identified nonpoint sources.
- Identifies and describes state programs for controlling pollution from identified nonpoint sources.

To be eligible for funding under CWA Section 319, states can use the information in Nonpoint Source Assessment Reports to develop and gain EPA approval for Nonpoint Source Management Plans. These management plans provide a framework to address the state's NPS control issues and to develop priorities for implementation. At a minimum, management plans must include:

- An identification of the BMPs selected to address the nonpoint sources identified in the Assessment Report.
- An identification of the programs to implement these BMPs.
- A schedule with annual milestones for program implementation.
- A certification of existing adequate legal authority to implement the program.
- A description of available federal and state funding sources to be used.

Through CWA Section 319, EPA has the authority to base annual NPS funding on its review and approval of these management plans. EPA usually grants funds to the state authority overseeing NPS control and allows the state authority to earmark the funds for specific programs, which are to be implemented on a watershed basis to the maximum extent possible. The priorities set in a state's management plan influence how the funds will be spent each year. Depending on the state, funding through this program could be available for a municipality, or a group of municipalities, to implement aspects of an NPS management program in a high-priority watershed. Funds from this program, however, are limited and are available mainly for demonstration projects to educate or establish the effectiveness of particular controls.

Coastal Zone Nonpoint Source Pollution Control

Under Section 6217(g) of the 1990 Coastal Zone Act Reauthorization, states with existing coastal zone management programs are required to establish coastal NPS programs approved by EPA and the National Oceanic and Atmospheric Administration (NOAA). These programs will be incorporated into the existing state NPS management plans (CWA Section 319) and state Coastal Zone Management Programs (CZMA Section 306). The purpose of Section 6217(g) is to encourage states to work with local authorities and other states to develop and implement a program of NPS pollution management to restore and protect coastal waters (U.S. EPA, 1991). This program is limited to NPS pollution control in coastal areas and the contribution of inland sources of pollution to degraded coastal water quality. In order to maintain a federally

approved coastal zone program, states must act to reduce NPS pollution through:

- Implementing EPA-specified management measures and additional state-developed measures to control NPS pollution in impaired or threatened coastal waters.
- Modifying the state coastal zone boundary, if necessary.
- Developing enforceable policies and mechanisms to implement the Coastal Zone Act Reauthorization management measures.
- Coordinating activities with existing CWA programs, such as basin planning (Section 303), NPS planning (Section 319), and the National Estuary Program (Section 320).
- Developing a technical assistance program for local governments and the public to implement the management measures.
- Developing a public participation program.

The coastal NPS program can directly affect municipalities in coastal areas with impaired or threatened waters if they are not covered by the NPDES municipal permit program (CWA Section 402). They will likely be required by the state coastal NPS control agency to implement management practices to address NPS pollution. In addition, since this program includes a requirement for states to reassess their coastal zone boundaries, municipalities that formerly were not within coastal areas might now be included.

EPA and NOAA, along with other federal and state agencies, are developing guidance materials: a document to assist states in developing their coastal NPS pollution control program (U.S. EPA, 1991) and a document specifying management measures for controlling NPS pollution in coastal areas (U.S. EPA, 1993). This management measures guidance document includes the following information for each management measure discussed:

- A description of activity categories and applicable locations.
- A listing of the pollutants addressed.
- A description of the water quality effects of implementation.
- An outline of the expected pollutant reductions achievable.
- A cost description.
- An outline of specific factors to be considered in adapting management measures to specific sites.

The major management measure categories are agriculture, forestry, urban, marinas and recreational boating, hydromodification, shoreline erosion, and wetlands. Where the proposed management measures do not address pollution problems adequately, states must develop additional management measures to prevent and reduce nonpoint sources of pollution. States with existing coastal zone management programs will be required to implement management measures in conformity with the approved NPS measures. This requirement could result in additional urban runoff pollution prevention and control requirements on affected coastal municipalities.

Clean Lakes Program

The Clean Lakes Program, initiated in 1972 under CWA Section 314, sets goals for defining the cause and extent of pollution problems in each state's lakes and for developing effective techniques to restore these lakes. Lake protection or restoration projects should include the development of watershed assessments that consider all point and nonpoint sources affecting lake quality. Each state is encouraged to organize and administer its own lakes program and to apply for EPA grants for lakes projects that meet state and EPA criteria.

A review of statewide lake quality, to be part of the biennial state Section 305(b) report, must include:

- Identification and classification of all publicly owned lakes.
- Description of the procedures, processes, and methods to control sources of pollution.
- Description of the methods and procedures to restore lake quality.
- Description of methods and procedures to control high acidity.
- List of the lakes for which uses are known to be impaired.
- Assessment of the water quality status and trends.

Clean Lakes projects are conducted in several phases: a diagnostic/feasibility study, implementation of recommendations, and long-term monitoring. The diagnostic section of the study must consist of the following information:

- Name, location, and hydrologic characteristics of the lake to be studied.
- Geologic description of the drainage basin.
- Public access to the lake.
- Size and economic structure of the watershed's population.

- Summary of historical lake uses.
- Adverse impacts caused by lake degradation.
- Water uses of the lake.
- Point sources of pollution to the lake and abatement actions to reduce this pollution.
- Land uses in the lake watershed.
- Discussion and analysis of historical baseline limnological data and 1 year of current limnological data as described in 40 CFR Part 35.
- Identification and discussion of biological resources in the lake.

The feasibility section should include:

- Identification and discussion of pollution control alternatives.
- Benefits expected from implementing the project.
- Long-term monitoring schedule.
- Proposed milestone implementation schedule.
- Description of how nonfederal funds will be obtained for the project.
- Relationship between the proposed lake project and other water pollution control initiatives in the area.
- Summary of public participation in developing and assessing the project.
- Operation and maintenance plan.
- Copies of all permits and impending permits applicable to the project.

Once a diagnostic/feasibility report has been submitted and approved, federal grants may be available to implement project recommendations.

National Estuary Program

With the 1987 passage of CWA amendments (Section 320), Congress created the National Estuary Program (NEP) to identify nationally significant estuaries, protect and improve their water quality, and enhance their living resources (U.S. EPA, 1990b). NEP estuary selection is based on the estuaries' potential to include environments of significant national concern and the demonstrated commitment by involved local parties to protect these valuable resources. Currently, 21 estuaries are part of the NEP (see Table 2-1). Common problems found in these estuaries include pollution from agricultural and urban runoff and waste disposal activities, as well as high levels of toxins and pathogens, excess nutrient loading, habitat loss, and declining abundance of living marine resources.

Table 2-1. Estuaries in the National Estuary Program as of 1993

Albemarle-Pamlico Sounds, NC	Narragansett Bay, RI
Buzzards Bay, MA	New York/New Jersey Harbor, NY/NJ
Casco Bay, ME	Peconic Bay, NY
Chesapeake Bay, MD/PA/VA	Puget Sound, WA
Corpus Christi, TX	San Francisco Bay, CA
Delaware Bay, DE	San Juan Bay, PR
Delaware Inland Bays, DE	Santa Monica Bay, CA
Galveston Bay, TX	Sarasota Bay, FL
Indian River Lagoon, FL	Tampa Bay, FL
Long Island Sound, CT/NY	Tillamook Bay, OR
Massachusetts Bay, MA	

Once an estuary is accepted into the NEP, EPA formally convenes a Management Conference of Agency and local representatives to develop a Comprehensive Conservation and Management Plan (CCMP) to protect the estuary. The Management Conference must also build support to carry out the CCMP recommended actions, conduct extensive research, and implement projects to improve the water quality of the estuary. These projects are usually demonstration activities implemented on a small scale, but can be applicable to larger areas of an estuary.

The NEP is not specifically designed to address the issue of NPS pollution. All 21 estuaries currently in the program have identified storm water runoff and diffuse source pollution as problems. Municipalities located within an NEP estuary's watershed might be encouraged as part of the CCMP, therefore, to address diffuse source pollution issues. In addition, the NEP is a potential funding source for urban runoff control projects. Municipalities in the watersheds of major coastal embayments should be aware of this program and understand the management structure and program objectives of local NEPs.

Agricultural Nonpoint Source Programs

While this handbook focuses primarily on storm water and NPS pollution issues in urban watersheds, many municipalities have outlying agricultural and other areas that contribute solids, nutrients, pesticides, herbicides, and pathogenic organisms to urban receiving waters. In many areas of the country, a basinwide approach must be taken to correct receiving-water impacts, and the basin is likely to contain agricultural activities. The U.S. Department of Agriculture (USDA) administers programs that address agricultural NPS problems. These programs are managed by the Soil Conservation Service (SCS) and the Agricultural Stabilization and Conservation Service (ASCS), which conduct

research; undertake demonstration projects; develop technologies; and provide education, technical assistance, and funding (Margheim, 1990).

USDA programs do not set specific regulatory controls on agricultural practices to prevent or reduce diffuse source pollution. Rather, they provide technical assistance and cost-sharing-based funding to farmers for implementing agricultural BMPs, such as animal waste control systems, conservation tillage, vegetative buffer strips, and filter strips. Also, informational and educational services are provided through these programs by the Cooperative Extension Service.

Examples of USDA pollution control activities include:

- *Conservation operations*: Provides basic funding for technical assistance to farmers, other landowners, and units of government.
- *Small watershed projects:* Provides planning, technical, and financial assistance for implementation of BMPs in small watersheds.
- *Resource conservation and development projects:* Provides funding for personnel to coordinate interorganizational cooperation and coordination on certain environmental activities in designated multicounty areas.
- *Hydrologic unit areas:* Provides technical assistance to targeted agricultural watersheds to improve and protect water quality.
- *Demonstration projects:* Provides funding for planning, educational, technical, and financial assistance in agricultural watersheds for demonstrating and accelerating the adoption and implementation of new and innovative technologies that emphasize protecting ground water from agrichemicals.
- *Agricultural conservation program:* Shares cost of implementing agricultural conservation practices (BMPs) on farmland
- *Special projects:* Shares cost of implementing water quality BMPs in identified watersheds.
- *Other:* Accelerate technical assistance to regional projects such as National Estuary Programs; develop and transfer water quality technology, training, and public involvement; promote many locally oriented and organized water quality projects (e.g., Lakes Lay Monitoring Program, educational programs for schools, conferences on wetlands and sludge, and certification programs for pesticide use).

Summary

As demonstrated in this chapter, numerous regulations address urban runoff pollution prevention and control at the federal, state, and local levels. In planning a program, all applicable regulations should be considered and integrated. For example, the planning process outlined in this handbook can be used to develop plans to address pollution from separated or combined systems, or where both systems exist. The process applies to BMP programs both for CSO problems and for separate storm water; in many instances, both sources exist within the same watershed. It can also be used in multijurisdictional planning efforts where storm water, CSO, drinking-water protection, or other elements are controlled by different levels of state, regional, or local government.

Pasadena, California

REPORTED BY:

Caroline Jetter,
CSR No. 11568
Our File No. 1-62540

automotive repair shops, retail gasoline outlets, restaurants and single-family homes on hillsides.

Once adopted, the SUSMP would be a set of standards or criteria that developers and architects could use to design their projects in ways that will result to those properties contributing inherently less pollution when it rains.

Cities would use the SUSMPs to adopt their own enforceable ordinances and then apply them in their review and approval of project plans. SUSMP standards only apply to new development or substantial redevelopment projects in the applicable SUSMP categories.

As a consequence, the applicability of SUSMPs is limited, and their consequent effect on storm water quality in our streams will, at first, be relatively small.

As years pass and more and more property is redeveloped, a greater percentage of urban land will be retrofitted with SUSMPs. Eventually much of the L.A. Basin will gain the benefit of some enhanced level of storm water management.

It must be remembered, however, that SUSMPs are only a small part of the 1996 storm water permit requirements. Many other aspects of that permit address other issues and current problems.

SUSMPs are simply one long-term approach to address the ubiquitous problem of pollution from storm

FROM: Dennis A. Dickerson
Executive Officer

DATE: June 29, 2001

SUBJECT: **Announcement of a Storm Water Workshop, and Transmittal of the Second Draft – County of Los Angeles Municipal Storm Water NPDES Permit**

ATTACHMENTS: Distribution List
Second Draft – Permit
Second Draft – Staff Report

The Regional Water Quality Control Board (Regional Board) will conduct a workshop before the Board during a public meeting on:

Thursday, July 26, 2001, starting at 9:00 a.m.
at the Metropolitan Water District (MWD) Building, Board Meeting Room
700 North Alameda, Los Angeles

The purpose of the workshop is for Regional Board staff to provide background and a brief overview of a proposed draft permit. A tentative agenda for this workshop will be posted on our web site by July 15, 2001. The public will have opportunity to orally comment on this draft before the Board on July 26, 2001.

By way of background, the County and Cities in Los Angeles County discharge storm water under a municipal storm water permit (Board Order No. 96-054), which expires on July 30, 2001. Following the workshop on July 26, 2001, and after consideration of the public input received, the Regional Board will consider adoption of a renewed permit at a public meeting on October 25, 2001. As part of the renewal process, we are pleased to transmit a second draft of the proposed new permit – the Municipal Storm Water NPDES Permit for the County of Los Angeles and incorporated cities (except for the City of Long Beach, which is covered under a separate permit). We are also enclosing a draft staff report, containing technical justifications for changes from the existing permit. Please submit your comments on this second draft in writing, to this office by August 6, 2001, to the attention of Xavier Swamikannu. Your submittal by this date will provide us sufficient time to evaluate and consider the comments prior to the issuance of the third draft, which we plan to issue by September 6, 2001.

R0003395

Thank you for your attention to renewal of this important permit. We appreciate the comments received to date, and look forward to the publics' oral comments at our workshop on July 26th, and written comments due August 6th. In the meantime, should you have questions regarding specific areas of the second draft, please feel free to contact the appropriate staff person, as listed below.

Second Draft (June 29, 2001)

LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD

ORDER No. 01-XXX
(NPDES No. CAS004001)

WASTE DISCHARGE REQUIREMENTS

FOR

MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES

WITHIN THE COUNTY OF LOS ANGELES AND THE INCORPORATED CITIES THEREIN (EXCEPT FOR THE CITY OF LONG BEACH)

TABLE OF CONTENTS

Part 6. STANDARD PROVISIONS (continued)

STATE OF CALIFORNIA

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 01-xxx
NPDES PERMIT NO. CAS004001
WASTE DISCHARGE REQUIREMENTS
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES THEREIN, EXCEPT THE CITY OF LONG BEACH

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board) finds:

A. Existing Permit and Report of Waste Discharge

The Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the Los Angeles County Flood Control District (see Attachment A, List of Permittees), hereinafter referred to separately as Permittees and jointly as the Discharger, discharge or contribute to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems. The discharges flow to water courses within the Los Angeles County Flood Control District and into receiving waters of the Los Angeles region. These discharges are covered under countywide waste discharge requirements contained in Order No. 96-054 adopted by this Regional Board on July 15, 1996, and which replaced Order No. 90-079 adopted by this Regional Board on June 18, 1990. Order No. 96-054 also serves as a National Pollutant Discharge Elimination System (NPDES) permit for the discharge of municipal storm water.

B. Nature of Discharges and Sources of Pollutant

1. Storm water discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins that discharge into water bodies of the State. The quality of these discharges varies considerably and is affected by the hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary constituents of concern currently identified by the Los Angeles County Flood Control District 1994-2000 Integrated Receiving Water Impacts Report are cyanide, indicator bacteria, total dissolved solids, turbidity, total suspended solids, nutrients, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), diazinon, and chlorpyrifos.

2. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Permittees have no or limited

jurisdiction over. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine operation, nitrates from atmospheric deposition, heavy metals, lead from fuels, copper from brake pad wear, zinc from tire wear, dioxins as products of combustion, and bis (2-ethylhexyl) phthalate and mercury as resulting from atmospheric deposition, and natural-occurring minerals from local geology. However, the implementation of the measures set forth in this Order are intended to and will contribute to reduced entry of these pollutants into storm water and their discharge to receiving waters.

3. These compounds can have damaging effects on both human health and aquatic ecosystems. In addition, the high volumes of storm water discharged from MS4s in areas of urbanization can significantly impact aquatic ecosystems due to physical modifications such as bank erosion and widening of channels. It is anticipated that, due to the nature of storm water events (i.e., large volumes of water and high velocities) that there may be short-term, reversible impacts to beneficial uses that are not directly related to water quality.

4. Water quality assessments conducted by the Regional Board identified impairment, or threatened impairment, of beneficial uses of water bodies in the Los Angeles Region. The causes of impairments include pollutants of concern identified by the County of Los Angeles in the Integrated Receiving Water Impacts Report (1994-2000).

5. Studies and research conducted by other Regional agencies, academic institutions, and universities have also identified storm water and urban runoff as significant sources of pollutants to surface waters in Southern California., [*Surface Runoff to the Southern California Bight*, Southern California Coastal Water Research Project, (1992); *Impacts of Urban Runoff on Santa Monica Bay and Surrounding Ocean Waters* (Gersberg, R.M., 1995); *State of the Bay 1998*, Santa Monica Bay Restoration Project; *Storm Water Impact*, In, Southern California Environmental Report Card 1999, Institute of the Environment, University of California, Los Angeles (Stenstrom, M.S., 1999); *Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of Southern California Bight,* Shelly L. Moore and M. James Allen (1999); *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999); *Huntington Beach Closure Investigation: Technical Review* (University of Southern California, 2000); *A Regional Survey of the Microbiological Water Quality Along the Shoreline of the Southern California Bight,* Rachel T. Noble et al. (2001).

R0003408

6. Development and urbanization increase pollutant load, volume, and discharge velocity. First natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants providing an effective natural purification process. In contrast, pavement and concrete can neither absorb water

nor remove pollutants, and thus the natural purification characteristics are lost. Second, urban development creates new pollution sources as the density of human population brings with it proportionately higher levels of vehicle emissions, vehicle maintenance wastes, municipal sewage waste, pesticides, household hazardous wastes, pet wastes, trash, and other anthropogenic pollutants. Development and urbanization especially threaten environmentally sensitive areas. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. In essence, development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. These environmentally sensitive areas include Areas of Special Biological Significance, water bodies designated with a RARE beneficial use, Significant Natural Areas, and Significant Ecological Areas.

7. The increased volume, increased velocity, and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion and impair stream habitat. Studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving waters. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as 10 percent conversion from natural to impervious surfaces. Percentage impervious cover is a reliable indicator and predictor of potential water quality degradation expected from new development. (*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool*, Schueler, T. and R. Claytor, In, Effects of Water Development and Management on Aquatic Ecosystems (1995), ASCE, New York.)

8. The County of Los Angeles has identified as the five highest priority potential priority industrial and commercial critical source types, (I) wholesale trade (scrap recycling, auto dismantling); (ii) automotive repair/ parking; (iii) fabricated metal products; (iv) motor freight; and (v) chemical and allied products (*Critical Source Selection and Monitoring Report*, Los Angeles County Department of Public Works (Sept 1996). Monitoring conducted by Los Angeles County demonstrates that the priority industrial sectors and auto repair facilities (the only commercial sector) on the list, contribute significant concentrations of heavy metals to storm water (*Los Angeles County 1999-2000 Storm Water Monitoring Report*, Los Angeles County Department of Public Works (July 2000)).

9. A review of industrial waste/ pretreatment records performed in 1995 in the County of Los Angeles on illicit discharges indicates that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations. Illicit discharges from automotive service facilities and food service facilities have been identified elsewhere as a major cause of widespread contamination and water quality problems (Washtenaw

County Statutory Drainage Board. 1987. Huron River Pollution Abatement Program)

C. Permit Background

1. The essential components of the Storm Water Management Program, as established by federal regulations [40 CFR 122.26(d)] are: (i) adequate legal authority, (ii) fiscal resources, (iii) SQMP - (Public Information and Participation Program, Industrial/Commercial Facilities Program, Development Planning Program, Development Construction Program, Public Agency Activities Program, Illicit Connection and Illicit Discharges Elimination Program), and (iv) monitoring and reporting program.

2. The Permittees have filed a Report of Waste Discharge (ROWD), dated February 1, 2001, and applied for renewal of their waste discharge requirements and a proposed NPDES permit to discharge wastes to surface waters. The ROWD includes a proposed Storm Water Quality Management Plan (SQMP) and a Monitoring Program. The proposed SQMP contains programs previously approved under Board Order No. 96-054 in the following areas:

   Public Information and Participation
   Development Planning
   Development Construction
   Public Agency Activities
   Illicit Connection/Illicit Discharge Elimination Program

   These programs are revised pursuant to the provisions of this Order after adoption.

3. The County of Los Angeles has previously conducted source identification and pollutant characterization consistent with 40 CFR 122.26(d)(1)(ii) and (iii) under its storm water monitoring program. The Monitoring Program submitted with the ROWD proposes to advance the assessment of receiving water impacts, identification of sources of pollution, evaluation of Best Management Practices (BMPs), and measurement of long term trends in mass emissions.

4. The Regional Board has reviewed the ROWD and has determined it to be complete under the reapplication policy of MS4s issued by the USEPA (61 *Fed. Reg.* 41697). The Regional Board finds that the Permittees' proposed Storm Water Management Plan, incorporating the additional provisions contained in this Order would meet the minimum requirements of federal regulations.

5. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and fast food restaurants), or facilities that perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in storm

water. [References: Pitt *et al.*, *Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260 (1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study*, Western States Petroleum Association and American Petroleum Institute, (1994); *Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices*, Final Report, County of Sacramento (1993).]

6. Retail gasoline outlets are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from retail gasoline outlets have high concentrations of hydrocarbons and heavy metals. [*Schueler and Shepp* (1992)]. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks [*Rouge River National Wet Weather Demonstration Project, Task Product Memorandum – Evaluation of On-line Media Filters RPO-NPS-TPM59.00*, Wayne County, MI, March 1999]. The LA Regional Board and the San Diego Regional Board have jointly prepared a Technical Report on the applicability of new development BMP design criteria for retail gasoline outlets, (*Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts*, (June 2001)). Retail Gasoline Outlets in Western U.S. States (such as Washington and Oregon) are already subject to numerical BMP design criteria under the MS4 program, as well in other U.S. States.

7. The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline-monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline-monitoring requirement be incorporated in this Order. The shoreline pathogen monitoring requirements are outlined in the Monitoring Program for this Order.

D. Permit Coverage **R0003411**

1. The requirements in this Order cover all areas within the boundaries of the Permittee municipalities (see Attachment A) over which they have regulatory jurisdiction as well as unincorporated areas in Los Angeles County Flood Control District within the jurisdiction of the Regional Board. The Permittees serve a population of about 9.5 million [Reference: *2000 Census of Population and Housing,* Bureau of the Census, U.S.

Department of Commerce (2001)] in an area of approximately 3,100 square miles. Attachment B shows the map of the permitted area in Los Angeles County Flood Control District.

2. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the Los Angeles County Flood Control District, and not currently named in this Order, may operate storm drain facilities and/or discharge storm water to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. Consequently, the Regional Board recognizes that the Permittees will not be held responsible for such facilities and/or discharges. The Regional Board will coordinate with these facilities to implement programs that are consistent with the requirements of this Order. Regional Board will consider such facilities for coverage in 2003 under its NPDES permitting scheme pursuant to USEPA Phase II storm water regulations.

3. Sources of discharges into receiving waters in the County of Los Angeles but in jurisdictions outside its boundary include the following:

   About 34 square miles of unincorporated area in Ventura County, which drain into Malibu Creek and thence to Santa Monica Bay,

   About 9 square miles of the City of Thousand Oaks, which also drain into Malibu Creek and thence to Santa Monica Bay, and

   About 86 square miles of area in Orange County, which drain into Coyote Creek and thence into the San Gabriel River.

   The Regional Board will ensure that storm water management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that storm water management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this Order.

4. This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to control the discharge of pollutants in storm water to the maximum extent practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the United States.

5. Permittees have expressed their intention to work cooperatively to control the contribution of pollutants from one portion of the MS4 to another portion of the system. Permittees may control the contribution of pollutants to the municipal separate storm sewer system from non-permittee dischargers such as Caltrans, the U.S. Department of Defense, and other state and federal facilities, through interagency agreements.

E. Federal, State, and Regional Regulations

1. The Water Quality Act of 1987 added Section 402(p) to the federal Clean Water Act (CWA) (33 U.S.C Section 1251-1387). This section requires the U.S. Environmental Protection Agency (USEPA) to establish regulations setting forth NPDES requirements for storm water discharges in two phases.

   - The USEPA Phase I storm water regulations were directed at municipal separate storm sewer systems (MS4) serving a population of 100,000 or more, including interconnected systems and storm water discharges associated with industrial activities, including construction activities. The Phase I Final Rule was published on November 16, 1990 (55 *Fed Reg.* 47990).

   - The USEPA Phase II storm water regulations are directed at storm water discharges not covered in Phase I, including small municipal MS4s (serving a population of less than 100,000), small construction projects (one to five acres), municipal facilities with delayed coverage under the Intermodal Surface Transportation Efficiency Act of 1991, and other discharges for which the USEPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. The Phase II Final Rule was published on December 8, 1999 (64 *Fed Reg.* 68722).

2. The USEPA published an 'Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits' on August 26, 1996 (61 Fed. Reg. 43761). This policy discusses the appropriate kinds of water quality based effluent limitations to be included in NPDES storm water permits to provide for the attainment of water quality standards.

3. The USEPA published an 'Interpretative Policy Memorandum on Reapplication Requirements' for MS4 permits on August 9, 1996 (61 *Fed. Reg.* 41697). This policy requires that MS4 reapplication for reissuance for a subsequent five-year permit term contain certain basic information and information for proposed changes and improvements to the storm water management program and monitoring program.

4. The USEPA has entered into a Memorandum of Agreement (MOA) with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service for enhancing coordination regarding the protection of endangered and threatened species under Section 7 of the Endangered Species Act (ESA) and the CWA's Water Quality Standards and NPDES programs. Among other actions, the MOA establishes a framework for coordination of actions by the USEPA, the Services, and CWA delegated States on CWA permit issuance under Section 402 of the CWA [66 Fed. Reg., 11202 – 11217].

5. USEPA regulations at 40 CFR 122.26(d)(2)(iv)(A) and 40 CFR 122.26(d)(2)(iv)(C) require that Permittees implement a program to

monitor and control pollutants in discharges to the municipal system from industrial and commercial facilities that contribute a substantial pollutant load to the MS4. The regulations require that Permittees establish priorities and procedures for inspection of industrial facilities and priority commercial establishments. This permit, consistent with the USEPA policy, incorporates a cooperative partnership, including the specifications of minimum expectations, between the Regional Board and the Permittees for the inspection of industrial facilities and priority commercial establishments to control pollutants in storm water discharges (58 *Fed. Reg.* 61157).

6. Section 402 (p) of the Clean Water Act (33 U.S.C. Section 1342(p) provides that MS4 permits must "require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design engineering method and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." The State Board Office of Chief Counsel has issued a memorandum interpreting the meaning of MEP to include technical feasibility, cost, and benefit derived with the burden being on the municipality to demonstrate compliance (dated February 11, 1999).

7. Section 122.2 of the CWA authorizes the USEPA to delegate its NPDES permitting authority to states with an approved environmental regulatory program. The State of California is a delegated State. The Porter-Cologne Water Quality Control Act (California Water Code) authorized the State Water Resources Control Board (State Board), through the Regional Boards, to regulate and control the discharge of pollutants into waters of the State and tributaries thereto. The State Board entered into a Memorandum of Agreement [MOA] with the USEPA, on 22 September 1989, to administer the NPDES Program.

8. Section 303(d) of the CWA requires that the State identify a list of impaired water-bodies and develop and implement Total Maximum Daily Loads (TMDLs) for these waterbodies. A TMDL specifies the maximum amount of a pollutant that a water-body can receive and still protect beneficial uses. The USEPA entered into a consent decree with the Natural Resources Defense Council (NRDC), Heal the Bay, and the Santa Monica BayKeeper on March 22, 1999, under which the Regional Board must adopt all TMDLs for the Los Angeles Region within 13 years from that date. This permit incorporates a provision to implement and enforce approved load allocations for municipal storm water discharges and require changes to the Storm Water Quality Management Plan after pollutants loads have been allocated and approved.

R0003414

9. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA (16 U.S.C. Sections 1451-1465), amends the Coastal Zone Management Act of 1972, to address five sources of non-point pollution: agriculture, silviculture, urban,

marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The Regional Board addresses septic systems through the administration of other programs.

10. On May 18, 2000, the USEPA established numeric criteria for priority toxic pollutants for the State of California (California Toxics Rule) 65 *Fed. Reg.* 31682, for the protection of human health and aquatic life. These apply as ambient water quality criteria for inland surface waters, and enclosed bays and estuaries. The State Board adopted the, *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California – 2000*) on March 2, 2000, for implementation of the California Toxics Rule (State Board Resolution No. 2000-15 as amended by Board Resolution No. 2000-030). This policy requires that discharges comply with TMDL derived load allocations as soon as possible but no later than 20 years from the effective date of the policy. This Policy also establishes reporting protocols for the results on analytical determinations of chemical constituents and reporting levels (Minimum Level) in wastewater and storm water discharges.

11. The State Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on July 23, 1997. The Ocean Plan contains water quality objectives for the coastal waters of California.

12. The State Board In Re: California Department of Transportation (State Board Order WQ 2001-08), determined that the discharge of storm water to Areas of Special Biological Significance (ASBS) are subject to the prohibition in the Ocean Plan against the discharge of wastes to an ASBS.

13. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, *'Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994).' The Basin Plan, and amendments thereto, which are incorporated in this Order by reference, designates beneficial uses of receiving waters and specifies both narrative and numerical water quality objectives for the receiving waters in Los Angeles County.

14. The Regional Board on April 13, 1998, approved best management practices for sidewalk washing to minimize the discharge of wash waters to the storm drain system (Resolution No. 98-08). By the same Resolution, the Regional Board prohibited the discharge of municipal street wash waters to the storm drain system.

15. The Regional Board on April 13, 1998, approved recommended best management practices for industrial/ commercial facilities (Resolution No. 98-08).

16. The Regional Board on April 22, 1999, approved a list of best management practices for use in development planning and development construction (Resolution No. 99-03)

17. The Regional Board adopted and approved requirements for new development and significant redevelopment projects in Los Angeles County to control the discharge of storm water pollutants in post-construction storm water, on January 26, 2000, in Board Resolution No. R-00-02. The Regional Board Executive Officer issued the approved Standard Urban Storm Water Mitigation Plans (SUSMPs) on March 8, 2000. The State Board in large part affirmed the Regional Board action and SUSMPs in State Board Order No. WQ 2000-11 issued on October 5, 2000.

    - The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000,) which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary. Such areas include ministerial projects, projects in environmentally sensitive areas, and water quality design criteria for retail gasoline outlets.

    - The State Board's Chief Counsel interprets the Order to encourage regional solutions and endorses a mitigation fund or "bank" that may be funded by developers who obtain waivers from the numerical design standards for new development and significant redevelopment.

18. The Regional Board has determined that the creation of structural or treatment control BMPs for storm water mitigation in waters of the U.S. is not permissible. 40 CFR Part 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any waters of the U.S. Authorizing the construction of a storm water/ urban runoff treatment facility in a jurisdictional water body would tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment and/or mitigation in accordance with SUSMPs and any other requirements of this Order must occur prior to the discharge of storm water into a water of the U.S.

19. The Regional Board supports a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach should be to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It

emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

20. To promote a watershed management approach, the County of Los Angeles is divided into five Watershed Management Areas (WMAs) as follows:

    Malibu Creek and Rural Santa Monica Bay WMA
    Ballona Creek and Urban Santa Monica Bay WMA
    Los Angeles River WMA
    San Gabriel River WMA
    Dominguez Channel/Los Angeles Harbor WMA
    Santa Clara River WMA

    Attachment A shows the list of Permittees under each WMA and some Permittees have expressed an intent to form sub-watershed groups within the WMA to promote regional solutions for the mitigation of storm water discharge pollution.

21. To facilitate compliance with federal regulation, the State Board has issued two statewide general NPDES permits: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activity Storm Water Permit (GIASP)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (GCASP)]. The GCASP was reissued on August 19, 1999. The GIASP was reissued on April 17, 1997. Facilities discharging storm water associated with industrial activities and construction projects with a disturbed area of five acres or more are required to obtain individual NPDES permits for storm water discharges, or be covered by these statewide general permits by completing and filing a Notice of Intent (NOI) with the State Board. The USEPA guidance anticipates coordination of the state-administered programs for industrial and construction activities with the local agency program to reduce pollutants in storm water discharges to the MS4.

    The Regional Board is the enforcing authority in the Los Angeles Region for the two statewide general permits regulating discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites and discharges are also regulated under local laws and regulations.

22. The State Board, on October 28, 1968, adopted Resolution No. 68-16, "Maintaining High Quality Water" which established an anti-degradation policy for State and Regional Boards. This Policy restricts the degradation of surface waters and protects waterbodies where existing water quality is higher than is necessary for the protection of beneficial uses.

23. The State Board, on June 17, 1999, adopted Order No. WQ 99-05, which specifies standard receiving water limitations language to be included in all municipal storm water permits issued by the State and Regional Boards. The receiving water limitations included herein are consistent with the State Board Order, USEPA Policy, and the U.S. Appellate court decision in, *Defenders of Wildlife v. Browner* (9th. Cir, 1999). The State Board Office of Chief Counsel has determined that the federal court decision did not conflict with State Board Order No. WQ 99-05 (memorandum dated October 14, 1999)

24. California Water Code (CWC) Section 13263(a) requires that waste discharge requirements issued by the Regional Board shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; the need to prevent nuisance, and provisions of CWC Section 13241.

25. California Water Code Section 13370 *et seq.* requires that waste discharge requirements issued by the Regional Boards be consistent with provisions of the Federal Clean Water Act and its amendments.

F. Implementation

1. Permittees established an Executive Advisory Committee (EAC) to facilitate permit compliance and enhance consistency in program implementation. The EAC is formally incorporated within this permit as a representative committee of the Permittees.

2. The California Environmental Quality Act (CEQA) (Cal Pub Resources Code Section 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve for development. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects, which involve the use of established standards or objective measurements. A ministerial project may be made discretionary by adopting local ordinance provisions that create decision-making discretion . In the alternative, standards and objective criteria may be established administratively for storm water mitigation for ministerial projects. For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements.

3. On March 12, 2001, the United States Court of Appeals ruled that it is necessary to obtain a NPDES permit for application of aquatic pesticides to waterways. (*Headwaters, Inc. vs. Talent Irrigation District, 9th Cir.)* This decision is controlling in California for nonagricultural applications of pesticides to waterways.

4. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this Order requires that the SQMP specify BMPs that will be implemented to control the discharge of pollutants in storm water to the maximum extent practicable. Further, Permittees are to assure that storm water discharges from the MS4 shall neither cause or contribute to the exceedance of water quality standards and objectives nor create conditions of nuisance in the receiving waters, and that the discharge of non-storm water to the MS4 has been effectively prohibited.

5. The SQMP required in this Order builds upon the programs established in Order No. 90-079, and No. 96-054, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SQMP includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various components of the SQMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable. Provisions of the SQMP are fully enforceable under provisions of this Order.

6. The emphasis of the SQMP is pollution prevention through education, public outreach, planning, and implementation as source control BMPs first and then structural and treatment control BMPs next. Successful implementation of the provisions of the SQMP will require cooperation

and coordination of all public agencies in each Permittee's organization, among Permittees, and the regulated community.

7. The implementation of a Public Information and Participation Program is a critical component of a storm water management program. An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

8. This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP or requirement under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

9. This Order contemplates that the Permittees are responsible for considering potential storm water impacts when making planning decisions. This Order or any of its requirements are not intended to restrict or control local land use decision-making authority.

G. Public Process

1. The Regional Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written view and recommendations.

2. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.

3. The Regional Board has conducted public workshops to discuss the draft permit.

4. The Los Angeles County Flood Control District, the County of Los Angeles and the other municipalities are Co-permittees as defined in 40 CFR 122.26 (b)(1). Los Angeles County Flood Control District will coordinate with the other municipalities and facilitate program implementation. Each Permittee is only responsible for discharge for which it is the operator.

5. This Order shall serve as a National Pollutant Discharge Elimination System (NPDES) Permit, pursuant to Section 402 of the Federal Clean Water Act, or amendments thereto, and shall take effect 50 days from Order adoption provided the Regional Administrator of the USEPA has no objections.

6. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA (Cal Pub. Resources Code Section 21100 et seq.), in accordance with California Water Code Section 13389.

7. Pursuant to California Water Code Section 13320, any aggrieved party may seek review of this Order by filing a petition with the State Board. A petition must be sent to the State Water Resources Control Board, P.O. Box 100, Sacramento, California, 95812, within 30 days of adoption of the Order by the Regional Board.

8. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the federal NPDES program, and the California Water Code for the issuance of waste discharge requirements.

IT IS HEREBY ORDERED that the Los Angeles County Flood Control District, Los Angeles County, and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

Part 1. DISCHARGE PROHIBITIONS

Each Permittee shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges are:

1. covered by a separate individual or general NPDES permit for non-storm water discharges; or

2. within one of the categories below, and meet all conditions specified by the Regional Board Executive Officer:

   a) Category A - Natural flow:

      (1) Natural springs and rising ground water;

      (2) Flows from riparian habitats or wetlands;

      (3) Stream diversions, permitted by the State Board; and

      (4) Uncontaminated ground water infiltration [as defined by 40 CFR 35.2005(20)].

b) Category B - Flows from emergency fire fighting activity.

c) Category C - Flows incidental to urban activities, all of which are subject to conditions that shall be approved by the Regional Board Executive Officer:

(1) Reclaimed and potable landscape irrigation runoff;

(2) Water line flushing of potable water distribution systems;

(3) Drains for foundations, footings, and crawl spaces;

(4) Air conditioning condensate;

(5) Dechlorinated swimming pool discharges;

(6) Dewatering of lakes and decorative fountains;

(7) Non-commercial car washing by residents or by non-profit organizations; and

(8) Sidewalk rinsing.

The Regional Board Executive Officer may add or remove categories of non-storm water discharges above. Furthermore, in the event that any of the above categories of non-storm water discharges are determined to be a source of pollutants by the Regional Board Executive Officer, the discharge will no longer be exempt from this prohibition unless the Permittee implements conditions approved by the Regional Board Executive Officer to ensure that the discharge is not a source of pollutants. Notwithstanding the above, the Regional Board Executive Officer may impose additional prohibitions of non-storm water discharges in consideration of anti-degradation policies.

Part 2. RECEIVING WATER LIMITATIONS

1. Discharges from the MS4 that cause or contribute to the violation of water quality standards or water quality objectives are prohibited.

2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible for, shall not cause or contribute to a condition of nuisance.

3. The Permittee shall comply with Part 2.1. and 2.2. through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SQMP and its components and other requirements of this Order including any modifications. The SQMP and its components shall be designed to achieve compliance with receiving water limitations. If exceedances of water quality objectives or water quality standards (collectively, water quality standards) persist, notwithstanding implementation of the SQMP and its components and other requirements of this permit, the Permittee shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:

a) Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable water quality standard, the Permittee shall promptly notify and thereafter submit a report to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of water quality standards. This report may be incorporated in the annual update of the SQMP and its components unless the Regional Board directs an earlier submittal. The report shall include an implementation schedule. The Regional Board may require modifications to the Report.

b) Submit any modifications to the report required by the Regional Board within 30 days of notification.

c) Within 30 days following the approval of the report, the Permittee shall revise the SQMP and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, implementation schedule, and any additional monitoring required.

d) Implement the revised SQMP and its components and monitoring program according to the approved schedule.

4. So long as the Permittee has complied with the procedures set forth above and is implementing the revised SQMP and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional BMPs.

Part 3. STORM WATER QUALITY MANAGEMENT PLAN (SQMP) IMPLEMENTATION

A. General Requirements

1. Each Permittee shall, at a minimum, implement the SQMP. The SQMP is an enforceable element of this Order.

2. The SQMP shall, at a minimum, comply with the applicable storm water program requirements of 40 CFR 122.26(d)(2). The SQMP and its components shall be implemented so as to reduce the discharges of pollutants in storm water to the maximum extent practicable.

3. Each Permittee may develop a SQMP, incorporating the countywide SQMP, which identifies additional provisions intended to reduce the discharges of pollutants in storm water to the maximum extent practicable.

R0003423

B. Best Management Practice Implementation

The Permittees shall require implementation of the most effective BMPs for storm water/urban runoff pollution control benefits. When implemented, BMPs shall

result in the reduction of pollutants in storm water to the maximum extent practicable.

C. Modification of the Storm Water Quality Management Plan

The Permittees shall modify the SQMP, at the direction of the Regional Board Executive Officer, to incorporate additional provisions. Such provisions may include regional, watershed specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Daily Maximum Loads (TMDLs) for impaired water bodies.

D. Designation and Responsibilities of the Principal Permittee

The Los Angeles County Flood Control District is hereby designated as the Principal Permittee. As such, The Principal Permittee shall:

1. Coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for ensuring compliance of any individual Permittee.

1. Coordinate permit activities among Permittees and act as liaison between Permittees and the Regional Board on permitting issues.

2. Provide personnel and fiscal resources for compilation, evaluation and submittal of all reports required under this Order and updates of the SQMP and its components;

3. Provide technical and administrative support for committees that will be organized to implement the SQMP and its components;

4. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part F, below, upon designation of representatives;

5. Implement the Countywide Monitoring Program required under this Order and evaluate, assess and synthesize the results of the monitoring program;

6. Provide personnel and fiscal resources for the preparation and submittal to the Regional Board of annual reports and summaries of other reports required under the SQMP; and

7. Comply with the "Responsibilities of the Permittees" in Part 3.E., below.

E. Responsibilities of the Permittees

Each Permittee is required to comply with the requirements of this Order applicable to discharges within its boundaries, and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of the SQMP and any modifications thereto;

2. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of the SQMP applicable to such Permittee in an efficient and cost-effective manner;

3. Designate a technically knowledgeable representative to the appropriate WMC; and

4. Participate in intra-agency coordination (e.g. Fire Department, Building and Safety, Code Enforcement, etc.)necessary to successfully implement the provisions of this Order and SQMP.

5. Prepare an annual summary of expenditures applied to the storm water management program. This summary of budget expenditures shall identify the storm water budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:

   a) Program management

      (1) Administrative costs

      (2) Capital costs

   b) Illicit connection/illicit discharge

   c) Development planning

   d) Development construction

   e) Industrial/Commercial inspection/site visit activities

   f) Construction inspection activities

   g) Public Agency Activities

      (1) Maintenance of structural BMPs and treatment control BMPs

      (2) Municipal Street Sweeping

      (3) Catch basin clean-up

      (4) Trash collection

   h) Public Information and Participation

   i) Monitoring Program

   j) Miscellaneous Expenditures

6. Each Permittee, in addition to the budget summary, shall report any supplemental dedicated budgets, if any, for the same categories.

F. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).

2. The WMC's chair and secretary shall be chosen by the WMC upon Order adoption and on an annual basis, thereafter. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.

3. Each WMC shall:

   a) Facilitate cooperation and exchange of information among Permittees;

   b) Establish additional goals and objectives and associated deadlines for the WMA, as the program implementation progresses;

   c) Prioritize pollution control efforts based on beneficial use impairment(s), watershed characteristics and analysis of results from studies and the monitoring program;

   d) Develop and/or update and monitor the adequate implementation, on an annual basis, of the tasks identified for the WMA;

   e) Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the SQMP and its components;

   f) Continue to prioritize the Industrial/Commercial critical sources for investigation, outreach and follow-up.

   g) Conduct joint WMC meetings four times per year and, as necessary.

G. Executive Advisory Committee (EAC)

1. The EAC shall be composed of one representative from the Malibu Creek WMA, two representatives from each of the other WMAs, one representative from the City of Los Angeles, and one representative from the Los Angeles County Flood Control District.

2. The EAC shall facilitate program compliance in each watershed and enhance consistency among Permittees.

3. The EAC shall conduct its meetings in compliance with the Cal. Gov. Code § 54950 et seq.

H. Legal Authority

1. Permittees shall possess the necessary legal authority to prohibit non-storm water discharges, to the maximum extent practicable, to the storm drain system, including, but not limited to:

a) Prohibit illicit discharges and illicit connections and a requirement for removal of illicit connections;

b) Prohibit the discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other types of automotive service facilities;

c) Prohibit the discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

d) Prohibit the discharge of runoff to the MS4 from areas where repair of machinery and equipment which are visibly leaking oil, fluid or antifreeze, is undertaken;

e) Prohibit the discharge of runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

f) Prohibit the discharge of chlorinated swimming pool water and filter backwash to the MS4;

g) Prohibit the discharge of runoff from the washing of toxic materials from paved or unpaved areas to the MS4;

h) Prohibit washing impervious surfaces in industrial/commercial areas that results in a discharge of runoff to the MS4; and

i) Prohibit the discharge of concrete or concrete laden wash water from concrete trucks, pumps, tools, and equipment to the MS4.

j) Prohibit spills, dumping, or disposal of materials into the MS4, other than storm water, such as:

(1) Litter, landscape debris and construction debris;

(2) Any state or federally banned pesticide, fungicide or herbicide;

(3) Food wastes; and

(4) Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality.

k) Comply with conditions in Permittees ordinances, permits, contracts, model programs, or orders (i.e. hold dischargers to its MS4 accountable for their contributions of pollutants and flows);

l) Utilize enforcement mechanisms to require compliance with Permittees ordinances, permits, contracts, or orders;

m) Control of pollutants (including potential contribution) in discharges of storm water runoff associated with industrial

activities (including construction activities) to its MS4 and control the quality of storm water runoff from industrial sites (including construction sites). This requirement applies to source control, treatment control, and structural control BMPs; and,

n) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4. Permittees must possess authority to enter, sample, inspect, review and copy records, and require regular reports from industrial facilities discharging polluted or potentially polluted storm water runoff into its MS4 (including construction sites).

o) Require the use of best management practices (BMPs) to prevent or reduce the discharge of pollutants to MS4s to the maximum extent practicable.

p) On or before July 1, 2002, if necessary, amend and adopt a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of this permit.

2. The Principal Permittee shall, on or before July 1, 2002, amend the Los Angeles County Public Health Code to require inspections at restaurants that will address:

a) Oil and Grease residue to verify that it is not poured onto a parking lot, street or adjacent catch basin.

b) Dumpster areas to verify that the dumpster area is clean, dumpster lid closed, not filled with liquid or washed out.

c) Parking lot, alley, sidewalk and street areas to verify that floormats, filters and garbage containers are not washed in those areas and that no washwater is poured in those areas.

d) Parking lot area to verify that it is cleaned by sweeping and not by hosing down and that the facility operator uses dry methods for spill cleanup.

3. Each Permittee shall submit no later than July 31, 2002, a statement by the legal counsel that the Permittee has obtained all necessary legal authority to comply with this Order through adoption of ordinances and/or municipal code modifications.

Part 4. SPECIAL PROVISIONS

A. Best Management Practice Substitution

The Regional Board Executive Officer may approve any Best Management Practice (BMP) substitution upon petition by the Permittee(s), if the Permittee can document that:

1. The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of storm water pollutants; or

2. The fiscal burden of the original BMP or program is substantially greater than the proposed alternative and does not achieve a substantially greater improvement in storm water quality; and,

3. The proposed alternative BMP or program will be implemented within a similar period of time.

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall implement a PIPP that incorporates the components of the five-year education plan and the provisions of this section.

Permittees shall work collaboratively to implement a comprehensive education/outreach program with the following objectives:

a) To measurably increase the knowledge of the target audiences regarding the MS4, the impacts of storm water pollution on receiving waters, and potential solutions to mitigate the problems caused;

b) To measurably change the behavior of target audiences by encouraging implementation of appropriate solutions;

c) To involve and engage all socio-economic and ethnic groups in Los Angeles County to participate in mitigating the impacts of storm water pollution.

The Principal Permittee shall submit the PIPP to the Regional Board Executive Officer for review and approval on or before December 31, 2001, and annually thereafter.

1. PIPP - Residential Program

a) The Principal Permittee shall implement the Public Education Program as outlined in the SQMP, including the continuation of the following activities:

Advertising
Media Relations
Public Service Announcements
"How To" Instructional Material Distributed in a Targeted and Activity-Related Manner
Corporate, Community Association, Environmental Organization and Entertainment Industry Tie-Ins
1-888-CLEAN-LA and 888CleanLA.com
Events Targeted to Specific Activities and Population Sub-groups

b) "No Dumping" Message

Each Permittee shall mark all storm drain inlets that they own with a legible "no dumping" message. In addition, signs with prohibitive language discouraging illegal dumping must be posted at designated public access points to creeks, other relevant water bodies, and channels by October 25, 2003. Legible signage and storm drain messages shall be maintained as necessary.

c) Countywide Hotline

The 888-CLEAN-LA hotline will serve as the general public reporting contact for reporting clogged catch basin inlets and illicit discharges/dumping, faded or lack of catch basin stencils, and general storm water management information. Each Permittee may establish its own hotline if preferred. Permittees shall include this information, updated when necessary, in public information, and the government pages of the telephone book, as they are developed/published.

d) Outreach and Education

(1) The Principal Permittee shall implement the second Five-Year Education Plan as detailed in the SQMP.

(2) Each Permittee shall conduct educational activities within its jurisdiction and participate in countywide events.

(3) The Principal Permittee shall organize Public Outreach Strategy meetings with all Permittees on a quarterly basis. The Principal Permittee shall provide guidance for Permittees to augment the countywide outreach and education program. Permittees shall coordinate regional and local outreach and education to reduce duplication of efforts.

(4) The Principal Permittee shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water quality via print, local TV access, local radio, or other appropriate media.

(5) The Principal Permittee in cooperation with the Permittees shall provide all School Districts within its jurisdiction with materials, including videos, live presentations, brochures, and other media necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution. Permittees shall provide the contact information for their appropriate storm water staff to the Principal Permittee on November 25, 2001. Cooperative efforts with other agencies may also be used to accomplish this requirement.

e) Pollutant-Specific Outreach

Permittees shall coordinate to develop outreach programs that target the watershed-specific pollutants listed in Table 1on or before October 25, 2002. Metals may be appropriately addressed through the businesses program. Region-wide pollutants may be included in the Principal Permittee's mass media efforts. Programs shall focus on the anthropogenic sources of each pollutant.

Table 1.	
Watershed	***Target Pollutants for Outreach***
Ballona Creek	Trash, Indicator Bacteria, Metals, PAHs
Malibu Creek	Trash, Nutrients (Nitrogen), Indicator Bacteria, Sediments
Los Angeles River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs
San Gabriel River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals
Santa Clara River	*Reserved*
Dominguez Channel	Trash, Indicator Bacteria, PAHs

Each Permittee shall make outreach materials available to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate public counters and events. Outreach material shall include information on pollutants, sources of concern, and source abatement measures.

2. Businesses Program

a) Corporate Outreach

The Principal Permittee shall develop and implement a Corporate Outreach program to educate and inform corporate environmental management about storm water regulations. The program shall target retail gasoline outlet and restaurant chains. At a minimum, this program shall include:

(1) Conferring with corporate environmental management to explain storm water regulations;

(2) Distribution and discussion of educational material regarding storm water pollution and BMPs, and provide environmental managers with suggestions to facilitate employee compliance with storm water regulations.

Corporate Outreach for all retail gasoline outlet and restaurant chain corporations shall occur once every 2 years, but not less than twice during the permit term.

b) Business Assistance Program

(1) The Principal Permittee and Permittees with the available resources, including but not limited to the City of Los Angeles, may implement a Business Assistance Program to provide confidential, technical resource assistance to small businesses to advise them in BMPs implementation to reduce the discharge of pollutants in storm water runoff. At a minimum, programs may include:

(i) On-site technical assistance or consultation via telephone to identify and implement storm water pollution prevention methods and best management practices; and

(ii) Availability, distribution, and discussion of applicable BMP and educational materials.

C. Industrial/Commercial Facilities Program

Each Permittee shall implement an Industrial and Commercial Program with the objective of controlling and reducing pollutants in storm water runoff from Phase I, Automotive, RGOs and Restaurants to the maximum extent practicable. At a minimum, the Program shall include the following requirements:

1. Restaurants

The Principal Permittee shall inspect all restaurants to determine that each restaurant is effectively implementing storm water BMPs.

a) Frequency: The Principal Permittee shall inspect each restaurant once every 24 months.

b) Level of inspection: The Principal Permittee shall confirm that BMPs are effectively implemented in accordance with County ordinances, Regional Board Resolution 98-08, and the SQMP.

2. Retail Gasoline Outlets

The Principal Permittee shall communicate appropriate BMPs to each RGO to help ensure that RGOs are effectively implementing BMPs in accordance with the SQMP and Regional Board Resolution 98-08.

3. Automotive Service Facilities

Each Permittee shall inspect all Automotive Service Facilities within its jurisdiction, to confirm that such facilities are effectively implementing storm water BMPs.

a) Frequency: Each automotive service facility shall be inspected once every 24 months. If an inspection shows non-compliance with the SQMP and local storm water ordinances (including failure

to implement pollution prevention BMPs), the facility shall be re-inspected within 90 days.

b) Level of inspection: The Permittees shall determine that BMPs are effectively implemented, in accordance with the SQMP, Regional Board Resolution 98-08, and storm water ordinances. As necessary, Permittees shall advise owners/operators of Automotive Service Facilities to implement additional BMPs, necessary to reduce the discharge of pollutants in storm water to the maximum extent practicable.

4. **USEPA Phase I Facilities**

a) Database for Source Identification: Each Permittee shall annually update a watershed-based inventory of all USEPA Phase I facilities, Retail Gasoline Outlets, Automotive Service Facilities, and Restaurants within its jurisdiction, regardless of whether or not the facility is subject to the GIASP or other individual or general NPDES permits. The update of the database may be accomplished through the collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits). The inventory shall include the following minimum fields of information for each industrial and commercial facility:

(1) Name of facility and name of owner/operator;

(2) address;

(3) coverage under the GIASP or other individual or general NPDES permits; and

(4) a narrative description including SIC codes that best reflects the principal products or activities performed by each facility.

The use of an automated database system, such as Geographical Information System (GIS) or web-based system is highly recommended, but not required. The Permittees may add other fields of information, as necessary (e.g. to point out discrepancies between SIC Code designation and type of activities actually performed on-site, exposure of activities and/or materials to storm water, etc.).

b) Site Visits to USEPA Phase 1 Facilities: Based on the inventory developed under 4.a) above, each Permittee shall visit facilities that appear to be subject to requirements of USEPA Phase I storm water regulations, as specified below.

(1) Frequency: Each Permittee shall visit all facilities within 24 months from the Order adoption date.

(2) Level of visit: Each Permittee shall confirm that each owner/operator: (a) filed a Notice of Intent, and that a Storm Water Pollution Prevention Plan is available on-site, and (b) is in compliance with model programs for industrial and commercial facilities, with Permittees' storm water ordinances, and with Regional Board Resolution 98-08.

(3) Enforcement Referral: For any facility not enrolled under the GIASP (i.e. a non-filer), Permittees shall advise the owner/operator of such facility of its requirement to enroll in the GIASP, and shall document this action. On a quarterly basis, Permittees shall provide the Regional Board a copy of their records to identify non-filers.

c) Each Permittee shall develop a program to conduct spot checks of USEPA Phase I facilities, excluding those previously determined to pose no risk of exposure, in each year subsequent to the completion of the first inventory of USEPA Phase I facilities (i.e., first 24 months), but not less than 20% of the total number in each year. Facilities determined at no risk of exposure will be so identified in the inventory database.

d) In the event that particular minimum BMPs are infeasible at any site, Permittees shall require implementation of other equivalent BMPs. Furthermore, Permittees may require additional site-specific BMPs as necessary to comply with this Order, including BMPs that are more stringent than those required under the statewide GIASP. For industrial and specified commercial sites tributary to Clean Water Act section 303(d) impaired water bodies (where a site discharges pollutants for which the water body is impaired), Permittees may require implementation of additional controls as necessary to comply with this Order. For industrial and specified commercial sites within or directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas, Permittees may require implementation of additional controls as necessary to comply with this Order.

e) Nothing in this section precludes Permittees from performing additional activities to control storm water runoff from industrial and commercial facilities to their MS4, as they deem necessary, or through an already existing program. Also, nothing in this section precludes Permittees from enforcing their own municipal ordinances as they pertain to discharges of storm water runoff from industrial and commercial sites within their jurisdiction.

5. Interagency Coordination

In response to any complaint related to storm water or non-storm water discharges or a specific request by the Regional Board, a Permittee shall visit any facility, to determine if the facility is effectively complying with the SQMP and municipal storm water ordinances. In addition, Permittees

shall provide compliance assistance to the Regional Board through various supporting activities, including but not limited to: referrals of complaints, assisting in searches for current owners, operators, and leasees in conjunction with activities performed at any facility within its jurisdiction, appearing as witnesses in Regional Board enforcement hearings, and participating in joint inspections when requested by Regional Board staff.

Copies of the inspection/site visit report and any follow-up documentation performed as required in this section shall be provided to the Regional Board Executive Officer upon request.

D. Development Planning Program

1. The Permittees shall implement a development-planning program that will require all planning priority development and redevelopment projects to:

   a) Minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances and other legal authorities;

   b) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground;

   c) Minimize the quantity of storm water directed to impermeable surfaces and the MS4;

   d) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices;

   e) Provide for appropriate permanent measures to reduce storm water pollutant loads in storm water from the development site.

2. Peak Flow Control

   The Permittees shall develop and implement numerical criteria on or before October 31, 2002, to control the post-development peak storm runoff discharge rates in natural drainage systems to maintain or reduce pre-development peak discharge rates to prevent down-stream erosion, and to protect stream habitat. Natural drainage systems include the following:

   a) Malibu Creek

   b) Topanga Canyon Creek

   c) Upper Los Angeles River

   d) Upper San Gabriel River

   e) Santa Clara River

f) Named and unnamed coastal drainages

3. Standard Urban Storm Water Mitigation Plans

a) Each Permittee shall require that single-family hillside home developments:

(1) Conserve natural areas

(2) Protect slopes and channels

(3) Provide storm drain system stenciling and signage

(4) Divert roof runoff to vegetated areas before discharge

(5) Direct surface flow to vegetated areas before discharge

b) Each Permittee shall require that a Standard Urban Storm Water Mitigation Plan as approved by the Regional Board in Board Resolution No. R 00-02 be implemented for the following categories of developments with immediate effect:

(1) Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)

(2) A 100,000 or more square feet industrial/ commercial development

(3) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)

(4) Retail gasoline outlets

(5) Restaurants (SIC 5812)

(6) Parking lots 5,000 square feet or more or with 25 or more parking spaces

c) The Permittees shall require the implementation of SUSMPs provisions for all projects located in or directly adjacent to or discharging directly to an environmentally sensitive area, where, the development will:

(1) create 2,500 square feet or more of impervious area, or

(2) alter the area of imperviousness of the site to ten or more percent of the naturally occurring condition, and

(3) discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat

4. Numerical Design Criteria

The Permittees shall require that post-construction treatment control BMPs incorporate, at a minimum, the following design criteria to mitigate (infiltrate, filter or treat) storm water runoff:

a) Volumetric Structural or Treatment Control BMP

(1) the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

(2) the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

(3) the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

(4) the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

and/or

b) Flow Based Structural or Treatment Control BMP

(1) the flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity, or

(2) the flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County

(3) the flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above,

5. Applicability of Numerical Design Criteria **R0003437**

The Permittees shall require the following categories of planning priority projects to design and implement post-construction treatment and structural controls to mitigate storm water pollution:

a) Single-family hillside residential developments of one acre or more

b) Housing developments (includes single family homes, multifamily homes, condominiums, and apartments) of one acre or more.

c) A 100,000 square feet or more industrial/ commercial development

d) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534 and 7536-7539) [5,000 square feet or more]

e) Retail gasoline outlets [5,000 square feet or more and with projected Average Daily Traffic (ADT) of 100 or more vehicles]

f) Restaurants (SIC 5812) [5,000 square feet or more]

g) Parking lots 5,000 square feet or more or with 25 or more parking spaces

h) Projects located in, adjacent to or discharging directly to environmentally sensitive areas that meet threshold conditions identified above in 3.c.

6. Not later than March 9, 2003, each Permittee shall require the implementation of SUSMP and post-construction control requirements for the industrial/commercial category to projects one acre and greater to conform to USEPA Phase II storm water regulations.

7. Site Specific Mitigation

a) Each Permittee shall require the implementation of a site-specific plan to mitigate post-development storm water for developments not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where the following project characteristics exist:

(1) Vehicle or equipment fueling areas;

(2) Vehicle or equipment maintenance areas, including washing and repair

(3) Commercial or industrial waste handling or storage

(4) Outdoor handling or storage of hazardous materials;

(5) Outdoor manufacturing areas

(6) Outdoor food handling or processing

(7) Outdoor animal care, confinement, or slaughter

(8) Outdoor horticulture activities

R0003438

8. Redevelopment Projects

The Permittees shall apply the SUSMP, or site specific requirements including post-construction storm water mitigation to all planning priority projects that undergo significant redevelopment in their respective categories. Significant redevelopment means land-disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Where

significant redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated.

9. Maintenance Agreement and Transfer

Each Permittee shall require that all developments subject to SUSMP and site specific plan requirements provide verification of maintenance provisions for structural and treatment control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and or conditional use permits. Verification at a minimum shall include:

a) The developers signed statement accepting responsibility for maintenance until the responsibility is legally transferred, and either

b) A signed statement from the public entity assuming responsibility for structural or treatment control BMP maintenance and that it meets all local agency design standards, or

c) Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year, or

d) Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the structural and treatment control BMPs; or

e) Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction structural or treatment control BMPs

10. Regional Storm Water Mitigation Program

A Permittee or Permittee group may apply to the Regional Board for approval of a regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development. Upon review and a determination by the Regional Board Executive Officer that the proposal is technically valid and appropriate, the Regional Board may consider for approval such a program if its implementation will result in equivalent or improved storm water quality and protect stream habitat.

11. Mitigation Funding

The Permittees may propose a management framework, for endorsement by the Regional Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where the following situations occur:

a) A waiver for impracticability is granted

b) Legislative funds become available

c) Off-site mitigation is required because of loss of environmental habitat

d) An approved watershed management plan exists that incorporates an equivalent or improved strategy for storm water mitigation for new development

12. California Environmental Quality Act (CEQA) Document Update

Each Permittee shall modify planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation, with immediate effect. The CEQA guidelines shall require consideration of the following:

a) Potential Impact of project construction on storm water runoff

b) Potential Impact of projects post-construction activity on storm water runoff.

c) Potential for discharge of storm water from areas from material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas.

d) Potential for discharge of storm water to impair the beneficial uses of the receiving waters or areas that provide water quality benefit

e) Potential for the discharge of storm water to cause significant harm on the biological integrity of the waterways and water bodies

f) Potential for significant changes in the flow velocity or volume of storm water runoff that can cause environmental harm

g) Potential for significant increases in erosion of the project site or surrounding areas

13. General Plan Update

a) Each Permittee shall amend, revise or update its General Plans to include watershed and storm water quality and quantity management considerations and policies when the following General Plans elements are updated or amended: (i) Land Use, (ii) Housing, (iii) Conservation, (iv) Open Space.

b) Each Permittee shall provide the Regional Board with the draft amendment or revision when a listed General Plan element or the

General Plan is noticed for comment in accordance with Govt. Code § 65350 et seq.

14. Targeted Employee Training

Each Permittee shall train its employees in targeted positions (whose jobs or activities are engaged in development planning) regarding the requirements of the development planning on an annual basis beginning no later than March 31, 2002, and more frequently if necessary.

15. Developer Technical Guidance and Information

a) Each Permittee shall develop and make available to developer development planning guidelines immediately.

b) The Principal Permittee in partnership with Permittees shall issue no later than March 31, 2003, a technical manual for the siting and design of BMPs for the development community in Los Angeles County. The technical manual may be adapted from the revised California Storm Water Quality Task Force Best Management Practices Handbooks scheduled for publication in September 2002. The technical manual shall at a minimum include:

(1) Specifications for treatment control BMPs based on flow-based and volumetric water quality design criteria for the purposes of countywide consistency,

(2) Criteria for control of peak discharge rates, velocities and duration,

(3) Expected pollutant removal performance ranges

(4) Maintenance considerations

(5) Cost considerations

E. Development Construction Program

Each Permittee shall implement a program to control runoff from construction activity at all construction sites within its jurisdiction. The program shall ensure the following minimum requirements are effectively implemented at all construction sites:

a) Sediments shall not be discharged to the MS4 or receiving waters. Sediments generated on the project site shall be retained using adequate structural drainage controls;

b) No construction-related materials, wastes, spills, or residues shall be discharged from the project site to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff;

c) Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at the project site; and

d) Erosion from slopes and channels will be prevented by implementing BMPs including, but not limited to: limiting of grading scheduled during the wet season; inspecting graded areas during rain events; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes; and

e) Discourage grading during the wet season. Proper justification for the need to grade during the wet season shall be provided to the Permittee. All erosion susceptible slopes shall be covered, netted, planted, or protected in any way that prevents sediment discharge from the site.

1. In addition, for construction sites one acre and greater, each Permittee shall require compliance with all conditions in section E. above and:

a) Shall require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP), prior to issuance of a grading permit for construction projects, that meets one or more of the following criteria:

(1) Will result in soil disturbance of one acre or more in size;

(2) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area; or

(3) Is located in a hillside area.

The Local SWPPP shall include appropriate construction site BMPs and maintenance schedules. (A State required SWPPP may be substituted by a Local SWPPP if the Local SWPPP is at least as inclusive as the requirements for a State SWPPP). The Local SWPPP must include the rationale used for selecting or rejecting BMPs. The project architect, or engineer of record, or authorized qualified designee, must sign a statement on the Local SWPPP to the effect:

"As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activity."

The landowner shall sign a statement to the effect: **R0003442**

"I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for

gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/or inaccurate information, failing to update the Local SWPPP to reflect current conditions, or failing to properly and/or adequately implement the Local SWPPP may result in revocation of grading and/or other permits or other sanctions provided by law."

The Local SWPPP certification shall be signed by the landowner as follows, for a corporation: by a responsible corporate officer which means (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures; for a partnership or sole proprietorship: by a general partner or the proprietor; or for a municipality or other public agency: by an elected official, a ranking management official (e.g., County Administrative Officer, City Manager, Director of Public Works, City Engineer, District Manager), or the manager of the construction activity if authority to sign Local SWPPPs has been assigned or delegated to the manager in accordance with established agency policy.

b) Shall inspect all construction sites with Local SWPPPs for storm water quality requirements during routine inspections a minimum of once during the wet season. The Local SWPPP shall be reviewed for compliance with local codes, ordinances, and permits. For inspected sites that have not adequately implemented their Local SWPPP, a follow-up inspection to ensure compliance will take place within 2 weeks. If compliance has not been attained, the Permittee will take additional actions to achieve compliance (as specified in municipal codes). If compliance has not been achieved, and the site is covered under the State General Construction Activity Storm Water Permit, each Permittee shall enforce their local ordinance requirements, and if non-compliance continues the Regional Board shall be notified for further joint enforcement actions.

c) Commencing March 10, 2003, shall require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of filing a Notice of Intent (NOI) for coverage under the State General Construction Activity Storm Water Permit and a certification that a SWPPP has been prepared by the project developer. The prepared SWPPP may satisfy the requirement under E.1. (in-lieu of Local SWPPP).

2. In addition, for sites five acres and greater, each Permittee shall:

a) Require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of filing a Notice of Intent (NOI) for coverage under the State General Construction Activity Storm Water Permit and a certification that a SWPPP has been prepared by the project developer. The prepared SWPPP may satisfy the requirement under E.1. (in-lieu of Local SWPPP).

b) Each Permittee shall require proof of an NOI and a copy of the SWPPP at any time a transfer of ownership takes place for the entire development or portions of the common plan of development where construction activities are still on-going.

c) Each Permittee shall use an effective system to track grading permits issued by each Permittee. A database or GIS system is encouraged, but not required, to be used to satisfy this requirement.

3. Each Permittee shall train employees in targeted positions (whose jobs or activities are engaged in construction activities including construction inspection staff) regarding the requirements of the storm water management program no later than March 31, 2002, and annually thereafter. A list of trained employees shall be maintained by each Permittee.

F. Public Agency Activities Program

1. Each Permittee shall implement a Public Agency program to minimize storm water pollution impacts from public agency activities. Public Agency requirements consist of:

Sewage Systems Operations
Public Construction Activities
Vehicle Maintenance/Material Storage Facilities Management
Landscape and Recreational Facilities Management
Storm Drain Operation and Management
Streets and Roads Maintenance
Parking Facilities Management
Public Industrial Activities
Emergency Procedures
Dry Weather Diversions

2. Each Permittee shall conduct an assessment of measures that can be implemented to reduce and/or prevent trash from entering the MS4 system. The Assessment and a schedule for implementation shall be submitted to the Regional Board Executive Officer for review by July 1, 2003.

3. Sewage System Operations

Each Permittee shall implement a response plan for overflows of the sanitary sewer system within their respective jurisdictions which shall consist at a minimum of the following:

R0003444

a) Investigation of any complaints received;

b) Immediate response to overflows by containment; and

c) Notification to appropriate sewer and public health agencies when a sewer overflows to the MS4.

In addition to 3.a, 3.b, and 3.c above, for those Permittees which own and/or operate a sanitary sewer system, each Permittee shall also implement the following requirements (until such time that the proposed Capacity, Management, Operation and Maintenance Regulations (CMOM) are promulgated by the USEPA. After which, the CMOM regulations shall be enforceable under this Order until such time they are added into an individual NPDES permit):

d) A program to prevent sewage spills or leaks from sewage facilities from entering the MS4; and

e) Identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4.

4. Public Construction Activities Management

a) Each Permittee shall implement a program to control runoff from construction activity at all construction sites. To accomplish this, the Permittees shall revise their Development Construction Program in the SQMP no later than March 31, 2002. The revisions shall specify a schedule for implementation by each Permittee, and must contain the following minimum elements, including performance measures, schedules for implementation, and shall include the following categories of construction:

(1) Less than one acre;

(2) Between one and five acres; and

(3) Five or more acres.

b) Each Permittee shall comply with requirements in section E. and with the following conditions, at all public construction sites:

(1) Design and construction of public facilities shall be consistent with the requirements and dates specified for private development in Part 4.D.;

(2) Prepare and retain site-specific SWPPPs for municipal construction sites;

(3) Implement construction and post-construction storm water controls as required of private construction projects, including numerical mitigation criteria for post-construction BMPs;

(4) Implement a program to ensure that SWPPPs and BMPs implemented are effective;

(5) Inspect public construction sites and implement changes as necessary to maintain or replace ineffective BMPs in order to protect water quality; and

(6) Each Permittee shall obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites 5 acres or greater (or part of a larger area of development, etc...) except that a municipality under 100,000 in population need not obtain coverage under a separate permit until March 10, 2003.

c) No later than March 9, 2003, each Permittee shall obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater.

5. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Each Permittee shall implement pollution prevention plans for public vehicle maintenance facilities and material storage facilities which have the potential to discharge pollutants into storm water.

b) Each Permittee shall implement BMPs to minimize pollutant discharges in storm water including but not be limited to:

(1) Good housekeeping practices;

(2) Material storage control;

(3) Vehicle leaks and spill control; and

(4) Illicit discharge control;

c) Each Permittee shall require that all vehicle/equipment wash areas be self-contained or covered, or equipped with a clarifier, or other pretreatment device, and properly connected to the sanitary sewer to prevent the discharge of pollutants to the MS4 for new facilities or during redevelopment of existing sites.

6. Landscape and Recreational Facilities Management

Each Permittee shall implement the following requirements:

a) A standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers;

b) Ensure no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied;

c) Ensure that no banned pesticides, herbicides, fungicides, or rodenticides are stored or applied;

d) Ensure that staff applying pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator;

e) Implement procedures to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs;

f) Store fertilizers and pesticides indoors or under cover on paved surfaces or use secondary containment;

g) Reduce the use, storage, and handling of hazardous materials to reduce the potential for spills; and

h) Regularly inspect storage areas.

7. Storm Drain Operation and Management

Each Permittee shall:

a) designate catch basin inlets within its jurisdiction as one of the following:

Priority A – catch basins that are designated as consistently generating the highest volumes and trash and/or litter.

Priority B - catch basins that are designated as consistently generating moderate volumes and trash and/or litter

Priority C – catch basins that are designated as generating low volumes of trash and/or litter.

b) Clean catch basins according to the following schedule:

Priority A –at least once per month during the wet season.

Priority B - Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 40% full during the wet season. From July 1, 2003 to the date this Order is renewed, each Permittee shall ensure that each catch basin is cleaned whenever the catch basin reaches 25% full during the wet season.

Priority C – as necessary but at least once per year.

c) For any special event that can be reasonably expected to generate quantities of trash and litter, the Permittee shall, as a condition of the special use permit issued for that event, include provisions that provide for the proper management of trash and litter generated from the event. At a minimum, the Permittee shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain.

d) For each Permittee subject to a trash TMDL, the Permittee may implement a program which maximizes trash removal by using an effective combination of street sweeping, catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve waste load allocations).

e) Each Permittee shall:

(1) Keep record of catch basins cleaned;

(2) Record the quantity of catch basin waste collected [The data shall be reported in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g., compacted volume based on a standardized compaction rate, dry weight, etc.). The Permittees may select the unit, but all Permittees shall use the same unit of measure.];

(3) Inspect the legibility of the catch basin stencil or label nearest the inlet. Illegible stencils shall be recorded and re-stenciled or re-labeled within 180 days of inspection; and

(4) Submit a record (preferably but not required, as a GIS layer) of all catch basins in a municipality and identify which are city-owned/county-owned, and which to note priority for more frequent cleaning.

f) Each Permittee shall implement BMPs for Storm Drain Maintenance that shall include:

(1) A program to visually monitor open channel storm drains for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection;

(2) A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality;

(3) Removal of trash and debris from open channel storm drains shall occur a minimum of once per year before the storm season;

(4) Minimize the discharge of contaminants during MS4 maintenance and clean outs;

(5) Record the quantity of open channel waste collected by stream or channel segment [The data shall be reported in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g., compacted volume based on a standardized compaction rate, dry weight, etc.). The Permittees may select the unit, but all Permittees shall use the same unit of measure.]; and

(6) Proper disposal of material removed.

8. Streets and Roads Maintenance

a) Each Permittee shall designate streets and/or street segments within its jurisdiction as one of the following:

Priority A – streets and/or street segments that are designated as consistently generating the highest volumes and trash and/or litter.

Priority B - streets and/or street segments that are designated as consistently generating moderate volumes and trash and/or litter.

Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter.

b) Each Permittee shall perform street cleaning according to the following schedule:

Priority A – These streets and/or street segments shall be swept at least two times per month.

Priority B - Between the effective date of this Order and July 1, 2003, each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month.

Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year.

c) Each Permittee shall require that sawcutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain.

d) Concrete and other street and road maintenance materials and wastes shall be managed to prevent pollutant discharges; and

e) The washout of concrete trucks and chutes shall only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system.

f) Each Permittee shall implement a program which maximizes trash removal by using an effective combination of street sweeping,

catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve TMDL waste load allocations.

g) Each Permittee shall train their employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:

(1) Promote a clear understanding of the potential for maintenance activities to pollute storm water; and

(2) Identify and select appropriate BMPs.

9. Parking Facilities Management

Permittee-owned parking lots shall be kept clear of debris and oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. In no case shall a Permittee-owned parking lot be cleaned less than once a month.

10. Public Industrial Activities

Each Permittee shall, for any municipal activity considered an industrial activity covered under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than November 25, 2001, except that a municipality under 100,000 in population need not file the NOI until March 10, 2003.

11. Emergency Procedures

Each Permittee shall continue to repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as: earthquakes; fires; floods; landslides; or windstorms. BMPs shall be implemented to the extent that measures do not compromise public health and safety. After initial emergency response or emergency repair activities have been completed, each Permittee shall implement BMPs as required under this Order.

12. Dry Weather Diversions **R0003450**

a) Each Permittee shall prioritize drains for possible diversion of dry weather flows from areas within their jurisdiction that flow to areas where the public may be impacted (for public health and safety and/or environmental reasons). The Permittees shall collectively review their individual prioritized lists and create a watershed based priority list of possible drains for diversion no later than March 31, 2002 and submit a listing of priority diversions to the Regional Board Executive Officer. The Permittees shall immediately begin a feasibility study and discussions with the appropriate sewer agency for diversion of selected dry weather

flows to the sanitary sewer for treatment, subject to approvals of the Regional Board and the appropriate sewer agency.

b) The Permittees shall investigate and determine the location of potential dry weather urban runoff treatment devices for strategic placements in areas of the watersheds where most appropriate. This information shall be submitted to the Regional Board Executive Officer no later than March 31, 2002.

G. Illicit Connections and Illicit Discharges Elimination Program

Permittees shall eliminate all illicit connections and illicit discharges to the storm drain system, and shall document, track, and report all such cases in accordance with the elements and performance measures specified in the following subsections.

1. General

a) Implementation: Each Permittee must develop an Implementation Program which specifies how each Permittee is implementing revisions to the IC/ID Program. This Implementation Program must be documented, and available for review and approval by the Regional Board Executive Officer, upon request.

b) Tracking: All Permittees shall develop and maintain a baseline map of their storm drain system, showing all storm drain connections permitted by the Permittee, at a scale and in a format specified by the Lead Permittee. On an annual basis, all Permittees shall map all illicit connections and discharges on their baseline maps, and shall transmit this information to, and in a format specified by, the Principal Permittee. No later than October 25, 2002, the Principal Permittee shall use this information as well as results of baseline and priority screening for illicit connections (as set forth in subsection 2 below) to start an annual evaluation of patterns and trends of illicit connections and illicit discharges, with the objectives of identifying priority areas for elimination of illicit connections and illicit discharges, and making recommendations for corrective action.

c) Training: All Permittees shall train all targeted employees who are responsible for identification, investigation, termination, cleanup, and reporting of illicit connections and discharges. For Permittees with a population of less than 250,000, training shall be completed no later than March 31, 2002. For Permittees with a population of 250,000 or more, training shall be completed no later than October 25, 2002. Furthermore, all Permittees shall conduct refresher training on an annual basis thereafter.

d) Documentation and Reporting: Document and report all illicit connections, illicit discharges, and hazardous substances that

"Anti-degradation policies" means the *Statement of Policy with Respect to Maintaining High Quality Water in California* (State Board Resolution No. 68-16) which protects surface and ground waters from degradation. In particular, this policy protects waterbodies where existing quality is higher than that necessary for the protection of beneficial uses including the protection of fish and wildlife propagation and recreation on and in the water.

"Applicable Standards and Limitations" means all State, interstate, and federal standards and limitations to which a "discharge" or a related activity is subject under the CWA, including "effluent limitations, "water quality standards, standards of performance, toxic effluent standards or prohibitions, "best management practices," and pretreatment standards under sections 301, 302, 303, 304, 306, 307, 308, 403 and 404 of CWA.

"Authorized Discharge" means any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

"Automotive Service Facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539.

"BAT/BCT Criteria" means treatment-based standards for reducing the discharge of pollutants, as defined in 40 CFR subchapter N, for specific categories of industrial facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards. Effluent limitations have been defined in 40 CFR for the reduction of toxic pollutants using Best Available Technology Economically Achievable (BAT) and for the reduction of conventional pollutants using Best Conventional Pollutant Control Technology (BCT).

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

"Beneficial Uses" means the existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

"Best Management Practices (BMPs)" are methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Construction" means constructing, clearing, grading, or excavation that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it

enter the storm drain, within times specified in subsections 2 and 3 below.

2. Illicit Connections

a) Baseline Screening: All Permittees shall continue to screen the storm drain system for illicit connections during scheduled infrastructure maintenance. On an annual basis, Permittees shall report, to the Lead Permittee, on the location and length of open channels or closed storm drains that have been screened, and on the status of suspected, confirmed, and terminated illicit connections.

b) Priority Screening: In addition to the baseline screening that will occur during regularly scheduled maintenance, Permittees shall design and implement a plan on or before October 31, 2002, subject to Regional Board Executive Officer approval, for proactive storm drain screening of priority areas that are, or are suspected to be a source of non-storm water discharges.

c) Investigation: Upon discovery through either baseline or priority screening, or upon receiving a report of a suspected illicit connection, Permittees shall initiate an investigation within 21 days, to determine the source of the connection, the nature and volume of discharge through the connection, and the responsible party for the connection.

d) Termination: Upon confirmation of the illicit nature of a storm drain connection, Permittees shall ensure termination of the connection within 180 days, using enforcement authority as needed. For those cases of illicit connections that require more than 180 days to eliminate due to lengthy court proceedings, the Regional Board Executive Officer may grant time extensions on a case by case basis.

3. Illicit Discharges

a) Abatement and Cleanup: Respond, within 72 hours of discovery or a report of a suspected illicit discharge, with activities to abate, contain, and clean up all illicit discharges, including hazardous substances.

b) Investigation: As soon as practicable, during or immediately following containment and cleanup activities, take enforcement action as appropriate.

Part 5. DEFINITIONS

The following are definitions for terms applicable to this Order:

"Adverse Impact" means a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

include emergency construction activities required to immediately protect public health and safety.

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

"Dechlorinated Swimming Pool Discharge" means swimming pool discharges which have no measurable chlorine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

"Development" shall mean any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction.

"Directly Adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Director" shall mean the Director of Public Works of the County and Person(s) designated by and under the Director's instruction and supervision.

"Directly Discharging" means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

"Discharge" when used without qualification means the "discharge of a pollutant."

"Discharge of a Pollutant" means: Any addition of any "pollutant" or combination of pollutants to "waters of the United States" from any "point source" or, Any addition of any pollutant or combination of pollutants to the waters of the "contiguous zone" or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works. This term does not include an addition of pollutants by any "indirect Discharger."

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Effluent limitation" means any restriction imposed by the Regional Board on quantities, discharge rates, and concentrations of "pollutants" which are "discharged" from "point sources" into "waters of the United States," the waters of the "contiguous zone," or the ocean.

"Environmentally Sensitive Areas" means an area "in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments" (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are: areas designated as Significant Ecological Areas by the County of

Los Angeles (*Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Game, Significant Natural Areas Program; an area listed in the Regional Board Basin Plan as supporting the "Rare, Threatened, or Endangered Species (RARE)" beneficial use; or an area identified by the Permittees as environmentally sensitive for water quality purposes[1]. See Attachment B for details of each listing.

"Executive Advisory Committee" means the committee composed of representatives of the Los Angeles County Flood Control District, the City of Los Angeles, and the five Watershed Management Areas.

"General Construction Activities Storm Water Permit (GCASP)" is the general NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of storm water from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" is the general NPDES permit adopted by the State Water Resources Control Board which authorizes the discharge of storm water from certain industrial activities under certain conditions.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

"Illicit Connection" shall mean any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit Discharge" means any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes all non storm-water discharges except discharges pursuant to an NPDES permit, discharges that are identified in Part 1 of this order, and discharges authorized by the Regional Board Executive Officer.

"Illicit Disposal" means any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water.

"Industrial/Commercial Facility" means any facility involved and/or used in either the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Infiltration" means the downward entry of water into the surface of the soil. R0003455

"Large Municipal Separate Storm Sewer System (MS4)" means all MS4s that serve a population greater than 250,000. The complete definition is contained in 40 CFR Section 122.26 (b)(4). The Regional Board designated Los Angeles County as a large MS4 in 1990,

[1] Regional Board is currently working with the City of Rancho Palos Verdes to recognize their identified local conservation areas

based on: (i) the U.S. Census Bureau 1990 population estimate of 8.9 million, and (ii) the interconnectivity of the MS4s in the incorporated and unincorporated areas within the County.

"Local SWPPP" means the Storm Water Pollution Prevention Plan required by the local agency if the project is not subject to the Statewide Construction Activities General Permit.

"Maximum Extent Practicable (MEP)" means the standard for implementation of storm water management programs to reduce pollutants in storm water. It is the maximum extent possible taking into account equitable consideration and competing facts, including, but not limited to: the gravity of the problem, public health risk, societal concern, environmental benefits, pollutant removal effectiveness, regulatory compliance, public acceptance, implementability, cost and technical feasibility. Section 402(p)(3)(B)(iii) of the CWA requires that municipal permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

"Method Detection Limit (MDL)" is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

"Minimum Level (ML)" is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body, that is designed or used for collecting or conveying storm water, which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

"National Pollutant Discharge Elimination System (NPDES)" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under sections 307, 402, 318, and 405 of CWA. The term includes an "approved program."

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-Storm Water Discharge" means any discharge to a storm drain that is not composed entirely of storm water.

"Nuisance" means anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent

of the annoyance or damage inflicted upon individuals may be unequal; (3) occurs during, or as a result of, the treatment or disposal of wastes.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used personally, for businesses or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Permit" means an authorization, license, or equivalent control document issued by USEPA or an "approve State" to implement the requirements of 40 CFR Parts 122, 123, and 124. "Permit" includes an NPDES "general permit" (§ 122.28). Permit does not include any permit which has not yet been the subject of final agency action, such as a "draft permit" or a "proposed permit."

"Permittee(s)" means Co-Permittees and any agency named in this Order as being responsible for permit conditions within its jurisdiction. Permittees to this Order include the Los Angeles County Flood Control District, Los Angeles County, and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

"Pollutants" means those "pollutants" defined in Section 502(6) of the federal Clean Water Act (33.U.S.C.§1362(6)), or incorporated into California Water Code §13373. Examples of pollutants include, but are not limited to the following:

- Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash, and sludge);
- Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and non-metals such as phosphorus and arsenic;
- Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants, and grease)
- Excessive eroded soils, sediment, and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the State;
- Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables, and show facilities);
- Substances having characteristics such as pH less than 6 or greater than 9, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus;

The term "pollutant" shall not include uncontaminated storm water, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

The term "pollutant" also shall not include any substance identified in this definition, if through compliance with the best management practices available, the discharge of such substance has been eliminated to the maximum extent practicable. In an enforcement action, the burden shall

be on the person who is the subject of such action to establish the elimination of the discharge to the maximum extent practicable through compliance with the best management practices available.

"Potable Water Distribution Systems" means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, well development, pump testing fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and wells.

"Priority Pollutants" are those constituents referred to in 40 CFR 401.15 and listed in the USEPA NPDES Application Form 2C, pp. V-3 through V-9.

"Project" means all development and land disturbing activities. The term is not limited to "Project" as defined under California Environmental Quality Act (Pub Resources Code Section 21065).

"Rain Event" means any rain event greater than 0.1 inch in 24 hours.

"Receiving Waters" means all surface water bodies within the permit area that are identified in the Basin Plan.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces. Where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where redevelopment results in an increase in less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the addition must be mitigated, and not the entire development.

"Regional Administrator" means the Regional Administrator of the Regional Office of the Environmental Protection Agency or the authorized representative of the Regional Administrator.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of many base flow components either contaminated with pollutants or uncontaminated.

"Side Walk Rinsing" means pressure washing of paved pedestrian walkways with average water usage of 0.006 gallons per square foot, with no cleaning agents, and properly disposing of all debris collected, as authorized under Regional Board Resolution No. 98-08.

"Site" means the land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"SQMP" shall mean the Los Angeles Countywide Stormwater Quality Management Program.

"Storm Water Pollution Prevention Plan (SWPPP)" shall mean a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

"Storm Water" shall mean storm water runoff, snow melt runoff, and surface runoff and drainage.

"Stormwater Quality Management Program" shall mean the Los Angeles Countywide Stormwater Quality Management Program, which includes descriptions of programs, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law, as the same is amended from time to time.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both treatment control BMPs and source control BMPs.

"SUSMP" means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address conditions and requirements of new development.

"Total Maximum Daily Load (TMDL)" means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

"Toxicity Identification Evaluation" means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

"Toxicity Reduction Evaluation" is a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

"USEPA Phase I Facilities" are facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
ii. manufacturing facilities
iii. oil and gas/mining facilities
iv. hazardous waste treatment, storage, or disposal facilities
v. landfills, land application sites, and open dumps
vi. recycling facilities
vii. steam electric power generating facilities
viii. transportation facilities
ix. sewage of wastewater treatment works
x. light manufacturing facilities

"Water Column Toxicity" means a 70 percent survival rate for a single test or an average of 90 percent survival for three consecutive tests.

"Water Quality Standards and Water Quality Objectives" applicable to the Permittee include those contained in the Los Angeles Regional Water Quality Control Plan (Basin Plan), the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

"Waters of the State" means any surface water or groundwater, including saline waters, within boundaries of the state.

"Waters of the United States" or "Waters of the U.S." means:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
b. All interstate waters, including interstate "wetlands";
c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    3. Which are used or could be used for industrial purposes by industries in interstate commerce;
d. All impoundments of waters otherwise defined as waters of the United States under this definition;

R0003460

e. Tributaries of waters identified in paragraphs (a) through (d) of this definition;
f. The territorial sea; and
g. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with US EPA.

"Wet Season" means the calendar period beginning October 1 through April 15.

"Whole Effluent Toxicity" means the aggregate toxic effect of an effluent measured directly by a toxicity test.

Part 6. STANDARD PROVISIONS

A. Standard Requirements

1. The Permittees shall comply with all provisions and requirements of this permit.

2. Should the Permittees discover a failure to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.

3. The Permittees shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.

4. This Order includes the attached Monitoring and Reporting Program, and Standard Urban Storm Water Mitigation Plan, which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

R0003461

B. Regional Board Review

1. Any formal determination or approval made by the Regional Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Regional Board. Such review may be requested upon

petition by a Permittee(s) or a member of the public within 30 days of the effective date of the notification of such decision to the Permittee(s).

C. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. Section 552 (as amended) and the Public Records Act (California Government Code Section 6250 *et seq.*).

2. All documents submitted to the Regional Board Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

D. Duty to Comply

1. The Principal Permittee must comply with all of the terms, requirements, and conditions of this Order. Any violation of this order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a combination thereof [40 CFR 122.41(a), CWC Section 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, 13350].

2. A copy of these waste discharge specifications shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees and members of the public.

3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

E. Duty to Mitigate [40 CFR 122.41 (d)]

The Permittees shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

F. Inspection and Entry [40 CFR 122.41(i), CWC Section 13267]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;

2. Access to copy any records that are kept under the conditions of this Order;

3. To inspect any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,

4. To photograph, sample, and monitor for the purpose of assuring compliance with this Order, or as otherwise authorized by the Clean Water Act and the California Water Code.

G. Proper Operation and Maintenance [40 CFR 122.41 (e), CWC Section 13263(f)]

The Permittees shall at all times properly operate and maintain all facilities and systems of treatment and (and related appurtenances) that are installed or used by the Permittees to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Permittee only when necessary to achieve compliance with the conditions of this Order.

H. Signatory Requirements [40 CFR 122.41(k)]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of Public Works, City Engineer, or authorized designee under penalty of perjury.

I. Reopener and Modification [40 CFR 122.41(f)]

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the Water Code and Title 23 of the California Code of Regulations for the issuance of waste discharge requirements, and upon prior notice and hearing, to:

   a) Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;

   b) Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;

c) Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or,

d) Consider any other federal, or state laws or regulations that became effective after adoption of this Order.

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

a) Violation of any term or condition contained in this Order;

b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,

c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

3. This Order may be modified, revoked and reissued, or terminated for cause.

4. The filing of a request by the Principal Permittee for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.

5. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR Part 122.63, if processed as a minor modification. Minor modifications may only:

a) Correct typographical errors, or

b) Require more frequent monitoring or reporting by the Permittee.

J. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected.

K. Duty to Provide Information [40 CFR 122.41(h)]

The Permittees shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Permittees shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

L. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)][2]

1. The Permittees shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time any Permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

2. The Regional Board may waive the required written report on a case-by-case basis.

M. Bypass [40 CFR 122.41(m)][3]

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited. The Regional Board may take enforcement action against Permittees for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.);

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;

3. The Permittee submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,

4. Permittees may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to

---

[2] This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the Los Angeles County SQMP are exceeded, and which endanger public health or the environment.

[3] This provision applies to the operation and maintenance of storm water controls and BMPs as provided in this Order or in the SQMP.

assure efficient operation. In such a case, the above bypass conditions are not applicable. The Permittee shall submit notice of an unanticipated bypass as required.

N. Upset [40 CFR 122.41(n)][4]

1. A Permittee that wishes to establish the affirmative defense of an upset in an action brought for non compliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

   a) An upset occurred and that the Permittee can identify the cause(s) of the upset;

   b) The permitted facility was being properly operated by the time of the upset;

   c) The Permittee submitted notice of the upset as required; and,

   d) The Permittee complied with any remedial measures required.

2. No determination made before an action for noncompliance, such as during administrative review of claims that non-compliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the Permittee seeking to establish the occurrence of an upset has the burden of proof.

O. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

P. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalties may be applied for each kind of violation. The Clean Water Act provides the following:

   a) Criminal Penalties for:

      (1) Negligent Violations:

      The CWA provides that any person who negligently violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

[4] *Supra*. See footnote number 2.

(2) Knowing Violations:

The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

(3) Knowing Endangerment:

The CWA provides that any person who knowingly violates permit conditions implementing sections 301, 302, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than $250,000, or by imprisonment for not more than 15 years, or both.

(4) False Statement:

The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed of required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than four years, or by both. (See section 309(c)(4) of the Clean Water Act.)

b) Civil Penalties

The CWA provides that any person who violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed $27,500 per day for each violation.

2. The California Water Code provides that any person who violates a waste discharge requirement provision of the California Water Code is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day or $25 per gallon per day of violation; or some combination thereof, depending on the violation or combination violations.

Q. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

R0003467

R. Modifications to this Order

This Order may be modified, revoked, or reissued, prior to the expiration date as follows:

1. To address changed conditions identified in the required technical reports or other sources deemed significant by the Regional Board;

2. To incorporate applicable requirements or statewide water quality control plans adopted by the State Board, or amendments to the Basin Plan;

3. To comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirements of the CWA then applicable; or,

4. Any amendments under the Clean Water Act.

S. Rescission

Regional Board Order No. 96-054 is hereby rescinded.

T. Expiration

This Order expires on [October 25, 2006]. The Principal Permittee must submit a Storm Water Quality Management Plan in accordance with Title 23, California Code of Regulation, not later than 180 days in advance of such date as application for reissuance of waste discharge requirements.

I, Dennis A. Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on October 25, 2001.

ATTACHMENT B

DESCRIPTIONS OF ENVIRONMENTALLY SENSITIVE AREAS

Significant Ecological Areas (Table B-1, Figure B-1)

Definition: Significant Ecological Areas (SEAs) are defined and delineated in conjunction with the Land Use and Open Space Elements of the Los Angeles County General Plan. An area qualifies for recognition as an SEA if it possesses one or more of the following features, or classes:

1. The habitat of core populations of endangered or threatened plant or animal species.
2. On a regional basis, biotic communities, vegetative associations, and habitat of plant or animal species that are either unique or are restricted in distribution.
3. Biotic communities, vegetative associations, or habitat of plant or animal species that are either unique or are restricted in distribution.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas that would provide for the preservation of relatively undisturbed examples of the original natural biotic communities in Los Angeles County.

Description: Current SEAs are listed in Table B-1[1]. Los Angeles County has conducted a study to update the SEA designations. Proposed boundaries of SEAs are shown on Figure B-1[2]. When the proposed SEAs included in the SEA Update Study 2000 are finalized, they will replace the current SEAs. The SEA Update Study 2000, and individual reports for each SEA are posted on the Los Angeles County Department of Regional Planning website at http://planning.co.la.ca.us/drp_revw.html#SEA

Rare, Threatened, or Endangered Species (Table B-2)

Definition: Rare, Threatened, or Endangered Species (RARE) is a beneficial use for waterbodies in the Los Angeles Region that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

Description: Specific waterbody reaches that support the RARE beneficial use are listed in Table B-2[3]. The accompanying maps depict reach areas in each watershed.

---

[1] Same as Table 1-1 from the Regional Board Basin Plan

[2] Map from the Los Angeles County SEA Update Study

[3] Same as Table 2-1, Beneficial uses of Inland Surface Waters from the Regional Board Basin Plan

Significant Natural Areas (Figure B-2)

Definition: Significant Natural Areas (SNAs), defined by the Department of Fish and Game (DFG), Significant Natural Areas Program, are areas that contain important examples of California's biological diversity. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

1. Areas supporting extremely rare species or habitats.
2. Areas supporting associations or concentrations of rare species or habitats.
3. Areas exhibiting the best examples of rare species and habitats in the state.

These criteria are strictly biological and do not account for levels of protection or threat. Sites may or may not be well protected. Detailed information on site protection, quality, and conservation needs is most readily available at the local level. The DFG Significant Natural Areas Program states that the purpose of identifying these areas is to draw the attention of planners and managers to these areas. The identification of SNAs does not imply any additional authority by the DFG.

Description: See Figure B-2 for a map of SNAs in Los Angeles County. Detailed descriptions of each area are attached. SNA maps, reports, and shape files can be downloaded from the DFG website at ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/.

TABLE B-1

Significant Ecological Areas (SEAs) in Los Angeles County.[1]

No.	Significant Ecological Area (SEA)	No.	Significant Ecological Area (SEA)
1	Malibu Coastline	33	Terminal Island

* Asterixed MUN designations are designated under SB 88-63 and RB 89-03. Some designations may be considered for exemptions at a later date. (See pages 2-3,4 for more details).

Footnotes are consistent on all beneficial use tables.

a Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.
b Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.
c Coastal waterbodies which are also listed in Coastal Features Table (2-3) or in Wetlands Table (2-4).
d Limited public access precludes full utilization.
e One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting
f Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.
g Condor refuge.
h Water contact recreational activities prohibited by Casitas MWD.
i Soledad Canyon is the habitat of the Unarmored Three-Spine Stickleback.

See pages 2-1 to 2-3 for descriptions of beneficial uses.

Footnotes are consistent for all beneficial use tables.

ac Beneficial uses for ground waters outside of the major basins listed on this table and outlined in Fig. 1-9 have not been specifically listed. However, ground waters outside of the major basins are, in many cases, significant sources of water. Furthermore, ground waters outside of the major basins are either potential or existing sources of water for downgradient basins, and as such, beneficial uses in the downgradient basins shall apply to these areas.

ad Basins are numbered according to California Department of Water Resources (DWR) Bulletin No. 118-80 (DWR, 1980).

ae Ground waters in the Pitas Point area (between the lower Ventura River and Rincon Point) are not considered to comprise a major basin and, accordingly, have not been designated a basin number by the DWR or outlined on Fig. 1-9.

af The Santa Clara River Valley (4-4), Pleasant Valley (4-6), Arroyo Santa Rosa Valley (4-7), and Las Posas Valley (4-8) Ground Water Basins have been combined and designated as the Ventura Central Basin (DWR, 1980).

P Potential beneficial use
See pages 2-1 to 2-3 for descriptions of beneficial uses.

Footnotes are consistent for all beneficial use tables.

ac Beneficial uses for ground waters outside of the major basins listed on this table and outlined in Fig 1-9 have not been specifically listed. However, ground waters outside of the major basins are, in many cases, significant sources of water. Furthermore, ground waters outside of the major basins are either potential or exisitng sources of water for downgradient basins, and as such, beneficial uses in the downgradient basins shall apply to these areas.

ad Basins are numbered according to DWR Bulletin No. 118-80 (DWR, 1980).

ag The category for the Foothill Wells area in the old Basin Plan incorrectly grouped ground water in the Foothill area with ground water in the Sunland-Tujunga area. Accordingly, the new categories, Foothill area and Sunland-Tujunga area, replace the Foothill Wells area.

ah Nitrite pollution in the groundwater of the Sunland-Tujunga area currently precludes direct MUN uses. Since the ground water in this area can be treated or blended (or both), it retains the MUN designation.

ai All of the ground water in the Main San Gabriel Basin is covered by the beneficial uses listed under Main San Gabriel Basin-eastern area and western area. Walnut Creek, Big Dalton Wash and Little Dalton Wash separate the eastern area from the western area (see dashed line on Fig 2-17). Any ground water upgradient of these areas is subject to downgradient beneficial uses and objectives, as explained in Footnote ac.

aj The border between Regions 4 and 8 crosses the Upper Santa Ana Valley Ground Water Basin.

ak Ground water in the Conejo-Tierra Rejada Volcanic Area occurs primarily in fractured vocanic rocks in the western Santa Monica Mountains and Conejo Mountain areas. These areas have not been delineated on Fig 1-9.

al With the exception of ground water in Malibu Valley (DWR Basin No. 4-22), ground waters along the southern slopes of the Santa Monica Mountains are not considered to comprise a major basin and accordingly have not been designated a basin number by DWR or outlined on Fig 1-9.

am DWR has not designated basins for ground waters on the San Pedro Channel Islands.

* Nearshore is defined as the zone bounded by the shoreline and a line 1000 feet from the shoreline or the 30-foot depth contours, whichever is further from the shore line. Longshore extent is from Rincon Creek to the San Gabriel River Estuary.

Footnotes are consistent for all beneficial use tables.

a Waterbodies are listed multiple times if they cross hydrologic area or subarea bounderies. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed seperately.
b Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.
c Coastal waterbodies which are also listed in Inland Surface Waters Table (2-1) or in Wetlands Table (2-4).
d Limited public access precludes full utilization.
e One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.
f Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs.
n Area is currently under control of the Navy; swimming is prohibited.
o Marine Habitats of the Channel Islands and Mugu Lagoon serve as pinniped haul-out areas for one or more species (i.e., sea lions).
p Habitat of the Clapper Rail.
an Areas of Special Biological Significance (along coast from Latigo Point to Laguna Point) and Big Sycamore Canyon and Abalone Cove Ecological Reserves and Point Fermin Marine Life Refuge.
ao Water contact recreation activities are prohibited by the Southern California Edison Co.
ap Water contact recreational activities are limited to the beach area at the harbor by Marina Authorities.
aq Water contact recreational activities are limited by City of Oxnard to within the easement area of each home.
ar Areas exhibiting large shellfish populations include Malibu, Dume, Point Fermin, White Point and Zuma Beach.

E: Existing beneficial use
P: Potential beneficial use
I: Intermittent beneficial use
E, P, and I shall be protected as required

Footnotes are consistent for all beneficial use tables.

a Waterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

b Waterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

c Coastal waterbodies which are also listed in Inland Surface Waters Table (2-1) or in Wetlands Table (2-4)

e One or more rare species utilize all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting

f Aquatic organisms utilize all bays, estuaries, lagoons and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced by freshwater inputs

sr Areas exhibiting large shellfish populations include Malibu, Point Dume, Point Fermin, White Point and Zuma Beach

ss Most frequently used grunion spawning beaches. Other beaches may be used as well.

w These areas are engineered channels. All references to Tidal Prisms in Regional Board documents are functionally equivalent to estuaries

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

MONITORING AND REPORTING PROGRAM - CI 6948

FOR

MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES, EXCEPT THE CITY OF LONG BEACH

(NPDES PERMIT NO. CAS004001)

I. Program Reporting Requirements

A. Program Management

Permittees shall submit, no later than (3 months following the adoption of this Order), the Annual Storm Water Report and Assessment (Annual Report) for the period July 1, 2000, through October 25, 2001 documenting the status of the storm water management program (Program) up to permit reissuance and the results of analyses from the monitoring and reporting program.

The Principal Permittee shall submit, by October 15 of each year beginning the year 2002, an Annual Report documenting the progress of Permittee implementation of the Storm Water Quality Management Plan (SQMP) and the requirements of this Order. An integrated summary of the results of analyses from the Monitoring Program described under *II. Monitoring Requirements* shall also be included. The Principal Permittee shall evaluate the Annual Report with the results of analyses from the Monitoring Program (e.g. if the monitoring results show a particular constituent consistently at elevated levels, that may be a trigger for Permittees to address their programs specifically for that particular situation and change them accordingly to address the problem).

The Annual Report shall cover each fiscal year from July 1 through June 30. At a minimum, the Annual Report will include the following:

1. All proposed changes to the SQMP as approved by the Executive Advisory Committee (EAC).

2. A comparison of program implementation results to performance standards established in this Order and in the SQMP.

3. Status of compliance with permit requirements including implementation dates for all time-specific deadlines. If permit deadlines are not met, Permittees shall report the reasons why the requirement was not met, how the requirements will be met in the future, including projected implementation date.

4. An assessment of the effectiveness of SQMP requirements to reduce storm water pollution. This assessment will be based upon the specific record-keeping information requirement in each major section of the

permit, monitoring data, and any other information related to program effectiveness. Beginning in the Year 2002, to the extent that data collected in monitoring requirements included herein and existing monitoring data allows, the Principal Permittee shall include an analysis of trends, land use contributions, pollutant source identifications, BMP effectiveness, and impacts on beneficial uses.

5. An analysis of the data to identify areas of the Program coverage which cause or contribute to exceedances of water quality standards or objectives, predominate land uses in these areas, and potential sources of pollutants in those areas.

6. Discussion of the compliance record and the corrective actions taken or planned that may be needed to bring the discharge into full compliance with the waste discharge requirements.

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall submit an annual PIPP Update to the Regional Board Executive Officer for approval. The PIPP Update shall include a summary of the overall strategy and any updates or modifications to the PIPP.

Programs for Residents

1. Number of storm drain inlets and designated public access points to creeks, channels, and other relevant water bodies in each Permittees' systems that are marked or posted with a no dumping message. If the requirement that 100 percent of storm drains inlets are marked/signed is not met, each Permittee shall report the reasons why, and how the requirement will be met in the future, including the implementation date.

2. Description of activities on distributing brochures, community outreach efforts, public communication efforts and educational programs in schools including an estimate of the number of impressions per year made on the general public about storm water quality via print, local TV access, local radio presentations, meetings or other appropriate media.

3. Description of the quarterly Public Outreach Strategy meetings, including percentage of Permittee attendance, effectiveness at coordinating Permittee education programs, and overall effectiveness based on Permittee evaluations. Also, a description of each Permittee's participation in and contribution to the PIPP.

4. Description of activities for the Pollutant-Specific Outreach programs, including creating and distributing outreach materials to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate counters and events.

Programs for Businesses

1. Description of the Corporate Outreach program, including the number of consultations with corporate-level management of gas stations and restaurant chains and the percentage of the total.

2. Description of the Business Assistance Program, including the number of businesses that requested assistance and the number that were assisted through site visits, telephone consultations, presentations, or material distribution.

C. Industrial/Commercial Facilities Program

1. An annual update of the watershed-based inventory of all Industrial/Commercial sites identified as a threat to water quality. This includes all Phase I industrial facilities, motor vehicle repair shops, motor vehicle body shops, motor vehicle parts and accessories facilities, restaurants, and other facilities that contribute or have the potential to contribute to impairments of receiving waters. The inventory shall include at a minimum: facility name, site address, SIC code and narrative description of activities performed at each facility.

2. Number of restaurants, automotive businesses, industrial facilities, and other commercial facilities targeted under the program. During the past year, the number of industrial and commercial inspections conducted, the number of non-compliant sites, and the number of industrial facilities the Permittees have identified that have failed to file an NOI.

3. The percentage of targeted staff trained annually.

D. Development Planning Program

1. Total number and percent of all development projects reviewed and conditioned to meet SUSMP requirements by category such as residential, commercial, and industrial.

2. Total square feet of impervious area conditioned for mitigation by development and redevelopment category.

3. Significant date rewrite completed of General Plan with storm water considerations.

4. Percent and total number of targeted staff trained annually [100 percent].

5. Date CEQA guidelines revision completed to include storm water mitigation conditions.

6. Date BMP design and sizing technical manual completed and made available electronically.

E. Construction Development Program

1. Number of construction projects requiring local SWPPPs in the past year and the percentage of projects in categories requiring submittal of a local SWPPP for which local SWPPPs were completed.

R0003537

2. Number and type of enforcement actions, applicable to storm water enforcement, taken at construction sites during the past year.

3. Description of the outreach program to the construction community and assessment of its effectiveness; This assessment should include a discussion of the number of inspections, or other meetings conducted.

4. The percentage of targeted staff trained annually.

F. Illicit Connections and Illicit Discharges Elimination Program

1. Annual update of the analytical tool used to manage and track illicit connections and discharges, including an evaluation of patterns and trends of illicit connections and illicit discharges in the entire storm drain system.

2. Location and length of open channels and closed storm drains that were screened by all Permittees, and the status of all suspected, confirmed, and terminated illicit connections.

3. Number of reports of illicit discharges that Permittees responded to, percentage that were identified as actual illicit discharges, and percentage of the actual illicit discharges where the incident was either cleaned up, referred to another responsible agency and/or follow up/education with the discharger was conducted.

4. Percentage of cleanup and abatement activities that occurred within 72 hours of discovery or report of a suspected illicit discharge and justification for response activities that exceeded 72 hours.

5. For groups of identified illicit discharge types where the probable causes for the discharge can be identified, report probable causes and the actions taken to prevent similar discharges from occurring.

6. Number of illicit connections identified in the past year.

7. Percentage of investigations that were initiated within 21 days of identification or a report of an illicit connection and justification for those that exceeded 21 days.

8. Number of illicit connections eliminated in the past year.

9. Percentage of illicit connections terminated within 180 days of identification and justification for terminations that exceeded 180 days.

10. Number and type of enforcement actions for storm water illicit discharges and/or illicit connections taken in the past year.

11. A summary from records on illicit discharges and connections which includes description of discharge, source, and enforcement action taken.

12. A summary from records on illicit connections which includes the number of illicit connections terminated by the issuance of a connection permit and those terminated by removal of the connection. This summary shall also include a breakdown of identified illicit connections by land use.

13. The percentage of targeted employees trained annually.

G. Programs for Facilities Maintenance

1. A summary which at a minimum includes the quantity, predominant types and likely sources of trash removed from catch basin inlets.

2. A summary of the total curb miles of streets swept annually and the percentage of total curb miles swept annually as a function of total curb miles.

3. The percentage of targeted staff trained annually.

H. Pollutants of Concern

1. A progress report on sources of pollutants of concern, BMPs for their control, and implemented BMP effectiveness.

I. Monitoring Program Management

1. The Principal Permittee shall submit a Storm Water Monitoring Report (Monitoring Report) on August 15, 2002, and annually on August 15, thereafter. The report shall include:

   a) Status of implementation of the monitoring program

   b) Results of the monitoring program

   c) A general interpretation of the results

   d) Data, results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each component of the monitoring program, including any specific reporting requirements included in Section II. Monitoring Program

   e) An analysis of trends, land use contributions, pollutant source identifications, BMP effectiveness, and impacts on beneficial uses

   f) Suggestions for improvements to the SQMP based on the analysis

   g) All monitoring reports shall be submitted in both electronic and paper formats

2. The Principal Permittee shall

3. The Principal Permittee shall submit, no later than (3 months following the adoption of this Order), the results of analyses from the monitoring and reporting program for the period July 1, 2000 through October 25, 2001 together with the Annual Report for the same period.

R0003539

J. All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k). Each report shall contain the following completed declaration:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Executed on the ___ day of _____ , 20_,

at _____.

(Signature)_____(Title)_____";

Permittee submittals to the Principal Permittee shall also be signed and certified pursuant to EPA regulations 40 CFR 122.41 (k).

The Principal Permittee shall mail the original of each annual report to:

INFORMATION TECHNOLOGY
CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
320 W. 4TH STREET, SUITE 200
LOS ANGELES, CA 90013

A copy of the annual report shall also be mailed to:

REGIONAL ADMINISTRATOR
ENVIRONMENTAL PROTECTION AGENCY
REGION 9
75 Hawthorne Street
San Francisco, CA 94105

R0003540

II. Monitoring Program

The primary objectives of the Los Angeles County Storm Water Quality Monitoring Program include, but are not limited to: 1) assessing compliance with this Order; 2) measuring and improving the effectiveness of the SQMPs; 3) assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff; 4) characterization of storm water

discharges; 5) identifying sources of pollutants; and 6) assessing the overall health and evaluating long-term trends in receiving water quality. Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMPs for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee shall implement the Countywide Storm Water Monitoring Program as follows:

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives: 1) estimate the mass emissions from the MS4; 2) assess trends in the mass emissions over time; and 3) determine if the MS4 is contributing to exceedances of water quality objectives by comparing results to objectives in the Basin Plan, Ocean Plan, and with emissions from other dischargers.

1. The Principal Permittee shall monitor mass emissions from the following seven mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and the Santa Clara River (location to be determined prior to the adoption of this Order). The Principal Permittee shall monitor the first storm event and a minimum of 2 additional storm events for each season. A minimum of two dry weather samples per year at each mass emission station shall also be analyzed.

2. All storms, in addition to those required above, totaling at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents and provide a more accurate estimate of median mass emissions (pollutant correlation with TSS). This requirement does not apply to manual sampling stations.

3. Samples for mass emission station monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms totaling 0.25 inches or greater of rainfall. Samples taken at mass emission stations during the first storm event should be analyzed for all constituents listed in Attachment U-1. The Principal Permittee may elect not to sample Volatile Organic Compounds from the list of constituents for mass emission stations.

4. Manual samples shall be collected from mass emission stations where it is not feasible to install an automatic sampler (Santa Clara River). Manual samples shall be time-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[1], unless the Regional Board Executive Officer approves alternate protocol.

[1] Provisions for flow-weighted composite samples set forth in 40 CFR 122.21(g)(7)

R0003541

5. For the first storm of each year, method detection limits (MDLs) lower than or equal to the minimum levels identified in the State Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2000 (SIP) shall be used. These levels are listed in column A in Attachment U-1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment U-1, the higher MDLs may be used for the remaining sampling events of that year. If a constituent has been detected in 100 percent of samples during the last 2 years of monitoring, the Principal Permittee may continue to use the MDLs listed in column B until the constituent is not detected, afterwhich, the method detection limits shall be lowered to those in column A.

6. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment U-1 in more than 25 percent of the first ten sampling events or on a rolling basis using ten consecutive sampling events, it need not be further analyzed, with the exception of the first storm of each season, unless the observed occurrences show high concentrations and are cause for concern.

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze two wet weather samples and two dry weather samples from each mass emission station for toxicity per year. A minimum of one freshwater and one marine species shall be used for toxicity testing. Specifically, Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization shall be used. Only Ceriodaphnia dubia shall be used for toxicity testing of samples from the Santa Clara mass emission station. If toxicity is not detected in either of the dry weather samples for any given mass emission station, the Principal Permittee may reduce dry weather toxicity testing to one sample per year at that station. If toxicity is not detected in either of the wet weather samples for any given mass emission station, wet weather toxicity testing may be reduced to one sample from the first storm of the wet season per year at that station.

2. Toxicity Identification Evaluations (TIE)

The Principal Permittee shall conduct Phase I TIEs on wet weather samples when two consecutive samples from the same monitoring station show toxicity and on dry weather samples when two consecutive dry weather samples from the same monitoring station show toxicity.

R0003542

3. Toxicity Reduction Evaluations (TRE)

a) The Principal Permittee shall perform a TRE for each pollutant or pollutant class that is identified as toxic. TREs shall include the following:

(1) An analysis of possible sources of toxicity, the identification of appropriate BMPs to eliminate toxicity and a time schedule for toxicity reduction that considers BMP implementation and effectiveness time. The Principal Permittee, Regional Board staff, and a third party will collaborate to develop and evaluate the analysis and recommendations.

(2) Submittal of the analysis to the Regional Board Executive Officer for approval.

The Principal Permittee may use EPA manual EPA/833B-99/002 (municipal) as guidance for TRE preparation.

b) Upon approval by the Regional Board Executive Officer, each Permittee having jurisdiction over sources causing or contributing to storm water toxicity shall be responsible for implementing the recommended BMPs to reduce toxicity.

c) During TRE development and implementation, the Principal Permittee shall continue monitoring the first storm and one dry weather event per year for toxicity at the subject station. According to the time schedule included in the TRE, the Principal Permittee shall analyze two wet weather and two dry weather samples for toxicity to evaluate the effectiveness of the TRE.

d) The Principal Permittee shall conduct a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds.

e) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Reports, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Tributary/Source Identification Monitoring

The Principal Permittee shall monitor select tributaries to identify sources of pollutants in subwatersheds, prioritize locations that need management actions, provide baseline information for TMDL development and allocate pollutant loads for TMDL development. An additional purpose of this monitoring is to validate the Land Use Model.

1. The Principal Permittee shall develop and implement a tributary/source identification monitoring program[2]. The following tributaries which have

[2] The Principal Permittee is currently working with Regional Board staff to modify this program

been identified as contributing the greatest loads of metals per acre in each subwatershed (based on the last four years of data for land use type, area, and rainfall) shall be monitored:

a) Centinela Creek (Ballona Creek WMA)
b) Kenter Canyon (Ballona Creek WMA)
c) Aliso Creek (Los Angeles River WMA)
d) Bull Creek (Los Angeles River WMA)
e) Compton Creek (Los Angeles River WMA)
f) Los Cerritos Channel (San Gabriel River WMA)
g) San Jose Creek (San Gabriel River WMA)

2. The Principal Permittee shall begin monitoring in the Los Angeles River watershed in the 2001-2002 storm season, and the San Gabriel River and Ballona Creek watersheds no later than the 2002-2003 storm season.

3. The Principal Permittee shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be time-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge[3], unless the Regional Board Executive Officer approves alternate protocol. Samples shall be taken just upstream of the tributary's confluence with the mainstem. Constituents to be analyzed for each location shall include the following:

   a) pH, dissolved oxygen, temperature, conductivity, and total suspended solids

   b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

   c) All other constituents for which the water body is impaired[4].

   d) Flow (flow may be estimated using EPA methods[5] at sites where flow measurement devices are not in place).

5. For the first storm of each year, MDLs lower than or equal to the minimum levels identified in the SIP shall be used. These levels are listed in column A in Attachment U-1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment U-1, the higher MDLs may be used for the remaining sampling events of that year.

---

[3] Provisions for flow-weighted composite samples set forth in 40 CFR 122.21(g)(7)

[4] The 1998 California 303(d) List and TMDL Priority Schedule lists pollutants for which each water body is impaired, www.swrcb.ca.gov/tmdl/docs/303d98.pdf#reg4

[5] NPDES Storm Water Sampling Guidance Document, EPA 833-B-92-001, July 1992

R0003544

6. The Principal Permittee shall submit a report identifying sources and/or source areas of pollutants within each watershed and priority management actions as part of the fourth Monitoring Report, to be submitted in 2005. The SQMP shall be modified to reflect the identified priority management actions.

D. Shoreline Monitoring

The City of Los Angeles shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from urban runoff. This component should be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the State of California's bathing water standards for public beaches and ocean water-contact sport areas[6], and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

   a) The eighteen established shoreline water quality stations listed in Attachment U-2 shall be monitored. Station locations may be modified based on recommendations from the Santa Monica Bay Restoration Project (SMBRP) and approval from the Regional Board Executive Officer;

   b) Three indicator groups shall be tested for using either membrane filtration, multiple tube fermentation, or chromogenic substrate test kits. Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
Total coliforms	CFU or MPN/100 ml	6/week (Mon-Sat)[7]
Fecal Coliform[8]	CFU or MPN/100 ml	6/week (Mon-Sat)[5]
Enterococcus	CFU or MPN/100 ml	6/week (Mon-Sat)[5]

[6] California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765

[7] Samples will be collected on Sundays preceding Monday holidays

[8] *Escherichia Coli (E. Coli)* may be substituted for Fecal Coliform if chromogenic substrate test kits are used

R0003545

c) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;

d) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches and their proximity to storm drains, as recommended by the SMBRP's Technical Advisory Committee and the Los Angeles County Department of Health Services (DHS).

e) Data collected shall be transmitted daily to the Los Angeles County DHS. Data shall be assessed annually and presented in the Annual Report;

f) When exceedances of public health standards for bacteria occur, the Principal Permittee shall notify the appropriate Permittees. Permittees shall initiate an investigation to determine the source, as required in the Program to Eliminate Illicit Connections and Discharges (Part 4.F.2.c.).

g) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the Santa Monica Bay Restoration Project regional program for the Santa Monica Bay.

E. Trash Monitoring

The Principal Permittee and the Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Attachment A) shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds. The Principal Permittee is encouraged to implement the program in the watersheds that are not presently listed on the 303(d) list for impairment for trash.

The Principal Permittee shall participate on regional monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Regional Monitoring participation shall include, but not necessarily be limited to, the efforts described below.

F. Estuary Sampling

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the southern California bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. A similar bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this bight-wide monitoring project, and should complete the estuary sampling requirement described below in parallel with this effort.

R0003546

In addition to participation in the Bight-wide study, the goal of this requirement is to sample estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertibrate community to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary which depicts the impacted areas shall be produced. The maps shall provide the information necessary to conduct effective sediment monitoring to determine trends and accumulation, as a future permit requirement.

1. The Principal Permittee shall sample a maximum of 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit cycle. Sediment samples shall be taken at each station by means of a $0.1m^2$ ($1.1 ft^2$) modified Van Veen sediment grab sampler.

2. The Principal Permittee shall also sample a total of 25 sites outside of the direct outfalls to assess cumulative effects.

3. All samples shall be analyzed for the following:
   a) Sediment Chemistry (priority pollutants)
   b) Total Organic Carbon (TOC)
   c) Grain size
   d) Sediment Toxicity
      (1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.
      (2) Phase I TIEs of interstitial water, using Ceriodaphnia dubia and Strongylocentrotus purpuratus (sea urchin) fertilization, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.
   e) Benthic Macroinvertibrates
      (1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.
      (2) The Principal Permittee shall identify all organisms to lowest possible taxon.
      (3) The Principal Permittee shall determine the Total Biomass of:
         (i) Mollusks
         (ii) Echinoderms
         (iii) Annelids/polychaetes
         (iv) Crustaceans
         (v) All other macroinvertebrates

R0003547

(4) The Principal Permittee shall determine the community structure analysis, including wet weight of each taxonomic group (listed above), number of species, number of individuals per species, total numerical abundance, species abundance per grab, species richness, species diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index[9].

4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water.

G. Bioassessment

The Principal Permittee shall continue participation on the Southern California Stormwater Research/Monitoring Program committee (coordinated by SCCWRP). The Regional Board anticipates that this program will organize an effort to evaluate the biological index approach for southern California and to design a research project for developing an Index of Biological Integrity (IBI) for this region. The Principal Permittee shall participate in this regional effort at least to the extent described below.

The purpose of this requirement is to detect biological trends in receiving waters and to collect data for the development of an IBI for southern California.

1. The Principal Permittee shall coordinate with the Southern California Stormwater Research/Monitoring Program and with the Surface Water Ambient Monitoring Program (SWAMP) being developed by the Regional Board to identify the most appropriate locations for bioassessment stations within Los Angeles County.

2. Station selection shall be complete within one year from the date this Order is adopted, and sampling shall begin in October of 2003.

3. The Principal Permittee shall monitor a minimum of 20 station events per year (either 20 stations in October of each year, or 10 stations in May and October of each year). A minimum of three replicate samples shall be collected at each station during each sampling event.

4. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized "Non-point Source Bioassessment Sampling Procedures" for professional bioassessment as set forth in the California Department of Fish and Game California Stream Bioassessment Procedure (CSBP)[10]. The following results shall be included in the annual Monitoring Report:

[9] Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the SCCWRP
[10] California Stream Bioassessment Procedure (Protocol Brief for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game - Aquatic Bioassessment Laboratory, May 1999. Located at www.dfg.ca.gov/cabw/protocols.html.

R0003548

a) All physical, chemical and biological data collected in the assessment;

b) Photographic documentation of assessment and reference stations;

c) Documentation of quality assurance and control procedures;

d) Analysis that shall include calculation of the metrics used in the CSBP;

e) Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;

f) Electronic data formatted to the California Department of Fish and Game Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database.

5. A professional environmental laboratory shall perform all sampling, laboratory, quality assurance, and analytical procedures.

H. New Development Impacts Study in the Santa Clara Watershed

The Principal Permittee and the City of Santa Clarita shall monitor tributaries in the Santa Clara watershed to determine impacts from new development and to compare storm water quality between subwatersheds with and without SUSMPs.

1. The Principal Permittee and the City of Santa Clarita shall select one station that is representative of a subwatershed in which the majority of development has occurred without SUSMP implementation, and one station (SUSMP station) in a subwatershed in which the majority of the development has/will include SUSMP implementation. Other inputs to runoff, such as septic systems, in the two subwatersheds should be similar.

2. The Principal Permittee shall coordinate with the City of Santa Clarita and the Regional Board to develop a proposed study design, including a description of the drainage areas to be monitored and sampling locations, no later than 180 days from the date this Order is adopted. If appropriate, this study may be conducted in conjunction with the Peak Discharge Impact Study, described in Section I.

3. The Principal Permittee and the City of Santa Clarita shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.

4. Samples shall be time-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within

each hour of discharge[11], unless the Regional Board Executive Officer approves alternate protocol. Constituents to be analyzed for each location shall include the following:

a) pH, dissolved oxygen, temperature, conductivity, chloride, nitrogen, and TSS

b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc.

c) Pathogen Indicators (Coliform)

d) Flow (flow may be estimated using EPA methods at sites where flow measurement devices are not in place)

5. For the first storm of each year, MDLs lower than or equal to the minimum levels identified in the SIP shall be used. These levels are listed in column A in Attachment U-1. Where SIP minimum levels are detected, those MDLs shall continue to be used. For constituents that are either not detected or detected at a concentration higher than the MDLs listed in column B in Attachment U-1, the higher MDLs may be used for the remaining sampling events of that year.

6. The Principal Permittee and the City of Santa Clarita shall submit an analysis of the data, including a description of each subwatershed, year-to-year changes compared to the amount of development that occurred in each, comparisons between stations, and an analysis of SUSMP effectiveness, with the fifth year Monitoring Report.

I. Peak Discharge Impact Study

The Principal Permittee shall participate in a study to evaluate peak storm water discharge rate (PDR) control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization (Part 4.C.2.). The Principal Permittee may partner with the Ventura County Flood Control District to extend their stream erosion study to the Santa Clara River watershed. The study shall begin no later than 360 days from the date this Order is adopted.

J. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control storm water best management practices. The objectives of this study shall include the following:

[11] Provisions for flow-weighted composite samples set forth in 40 CFR 122.21(g)(7)

R0003550

1. Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year proceeding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.

2. Evaluate the requirements, feasibility and cost of maintenance for each BMP.

3. Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the Santa Monica Bay Restoration Foundation's proposed study, "Performance Evaluation of Structural BMPs for Storm water Pollution Control in the Santa Monica Bay Watershed" to meet this requirement. Participation includes collaboration and resource contribution to expand the scope of the proposed study.

K. Standard Monitoring Provisions

1. The Principal Permittee shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

   Records of monitoring information shall include:

   a) The date, exact place, and time of sampling or measurements;

   b) The individual(s) who performed the sampling or measurements;

   c) The date(s) analyses were performed;

   d) The individual(s) who performed the analyses;

   e) The analytical techniques or methods used; and,

   f) The results of such analyses.

2. All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.

3. All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

4. If no flow occurred during the reporting period, the Monitoring Report shall so state.

5. For any analyses performed for which no procedure is specified in the EPA guidelines or in this Monitoring Program, the constituent or parameter analyzed and the method or procedure used must be specified in the Monitoring Report.

6. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring Program, after providing the opportunity for public comment, either:

   a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the annual Monitoring Report. Such petition shall be filed not later than 60 days after the Monitoring Report submittal date, or

   b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.

FACT SHEET/STAFF REPORT

FOR THE

COUNTY OF LOS ANGELES MUNICIPAL STORM WATER NPDES PERMIT (CAS004001)

Los Angeles Regional Water Quality Control Board

TABLE OF CONTENTS

R0003562

Second Draft – FACT SHEET/STAFF REPORT

State of California
California Regional Water Quality Control Board Los Angeles Region
National Pollutant Discharge Elimination System (NPDES)
Permit No. CAS004001, CI 6948
Regional Board Order No. 01-XXX

I. PURPOSE

The purpose of this Fact Sheet/Staff Report is to give the Permittees and interested parties an overview of the proposed permit as well as to provide the technical basis for the permit requirements. Sections I through IV describe water quality problems from urban runoff, and permit conditions to address these problems. Sections V and VI contain discuss each major element of the Permittees' Storm Water Quality Management Plan (SQMP), and is meant to be used as a reference document during review of the permit.

II. INTRODUCTION - THE NEED TO REGULATE STORM WATER DISCHARGES

A. Impacts

The quality of storm water and urban runoff are fundamentally important to the health of the environment and the quality of life in Southern California. Polluted storm water runoff is a leading cause of water quality impairment in the Los Angeles Region. Storm water and urban runoff, during dry and wet weather, are often contaminated with pesticides, fertilizers, animal droppings, trash, food wastes, automotive byproducts, and many other toxic substances generated by our urban environment. Water that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas carries these untreated pollutants through the storm drain networks directly into the receiving waters of the Region. Several of the documented water quality impacts and increased public health risks from Municipal Separate Storm Sewer System (MS4) discharges that affect receiving waters nationwide and Los Angeles County and its coastline are listed below.

The **National Urban Runoff Program** (NURP) Study (USEPA 1983) showed that MS4 discharges draining from residential, commercial, and light industrial areas contain more than ten times the annual loading of total suspended solids. Although the NURP Study did not target industrial sites, the study suggested that runoff from industrial sites may have significantly higher contaminant levels than runoff from other urban land use sites. Several studies tend to support this suggestion, such as the Fresno, California NURP project, which showed that industrial areas had the poorest storm water quality of the four land-uses evaluated. The study also found that pollutant levels from illicit discharges were high enough to significantly degrade receiving water quality, and threaten aquatic life, wildlife, and human health.

The **1998 National Water Quality Inventory** (305(b) Report)[1] showed that urban runoff/storm sewer discharges affect 11% of rivers, 12% of lakes, and 28% of estuaries.

[1] *Quality of Our Nation's Waters: Summary of the National Water Quality Inventory 1998 Report to Congress* - USEPA 841-S-00-001 - June 2000; *Water Quality Conditions in the United States: Profile from the 1998 National Water Quality Inventory Report to Congress* - USEPA 841-F-00-006 - June 2000

The report states that there was an increase in the impairment of ocean shoreline due to urban runoff/storm sewers from 55% in 1996 to 63% in 1998. The report notes that urban runoff and storm sewer discharges are the leading source of pollution and the main factor in the degradation of surface water quality[1] in California's coastal waters, rivers and streams.

The Natural Resources Defense Council (NRDC) 1999 Report, **"Stormwater Strategies, Community Responses to Runoff Pollution"**[2] identifies two main causes of the storm water pollution problem in urban areas. Both components are directly related to development in urban and urbanizing areas:

1. Increased volume and velocity of surface runoff. There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.

2. The concentration of pollutants in the runoff. Certain activities, such as those from industrial sites, are large contributors of pollutant concentrations to the storm water system.

The report also identified several activities causing storm water pollution from urban areas, practices of homeowners, businesses, and government agencies.

More recent studies conducted by **United States Geological Service** (USGS)[3] confirms the link between urbanization and water quality impairments in urban watersheds due to contaminated storm water runoff.

Other studies proved a direct link between polluted urban runoff and adverse health effects to humans.[4]

B. Benefits of Permit Program Implementation

Implementation of the MS4 permit requirements should significantly reduce pollutants in urban storm water in a cost-effective manner. Implementation of Best Management Practices (BMPs) should also reduce pollutant discharges, and improve surface water quality. The expected benefits of implementing the minimum measures of an MS4 NPDES permit include:

- **Enhanced Aesthetic Value**: Storm water affects the appearance and quality of a water body, and the desirability of working, living, traveling, or owning property near that water body. Reducing storm water pollution will increase benefits as these water bodies recover and become more desirable.
- **Enhanced Opportunities for Boating**: reducing sediment and other pollutants, and increasing water clarity, which enhances the boating experience for users, offer additional benefits.

[3] *Water Quality in the Puget Sound Basin, Washington and British Columbia, 1996-98,*Circular 1216 - USGS 2000; *Water Quality in the Long Island-New Jersey Coastal Drainages, New Jersey and New York, 1996-98,* Circular 1201 - USGS 2000
[4] *An Epidimiological Study Of Possible Adverse Health Effects Of Swimming In Santa Monica Bay* - Haile, R. W. et al, Santa Monica Bay Restoration Project, 1996

- **Enhanced Commercial Fishing**: Important because commercial fisheries are a significant part of the nation's economy, and 28% of the estuaries in the 305(b) Report were impacted by storm water/urban runoff.
- **Enhanced Recreational and Subsistence Fishing**: Pollutants in storm water can eliminate or decrease the numbers, or size, of sport fish and shell fish in receiving waters.
- **Reduced Flood Damage**: Storm water runoff controls may mitigate flood damage by addressing problems due to the diversion of runoff, insufficient storage capacity, and reduced channel capacity from sedimentation.
- **Reduced Illness from Consuming Contaminated Seafood**: Storm water controls may reduce the presence of pathogens in seafood caught by commercial or recreational anglers.
- **Reduced Illness from Swimming in Contaminated Water**: Epidemiological studies indicate that swimmers in water contaminated by storm water runoff are more likely to experience illness than those who swim farther away from a storm water outfall.
- **Enhanced Opportunities for Non-contact Recreation**: Storm water controls reduce turbidity, odors, floating trash, and other pollutants, which then allow waters to be used as focal point for recreation, and enhance the experience of the users.
- **Drinking Water Benefits**: Pollutants from storm water runoff, such as solids, toxic pollutants, and bacteria may pose additional costs for treatment, or render the water unusable for drinking.
- **Water Storage Benefits**: Storm water is a major source of impairment for reservoirs. The heavy load of solids deposited by storm water runoff can lead to rapid sedimentation of reservoirs and the loss of needed water storage capacity.[1]

III. STATUTORY AND REGULATORY HISTORY OF THE STORM WATER PROGRAM

Over the past 29 years, water pollution control efforts have focused primarily on certain process water discharges from facilities such as factories and sewage treatment plants, with less emphasis on diffuse sources. The 1972 amendments to the federal Clean Water Act (CWA) prohibit the discharge of any pollutant to waters from a point source, unless a NPDES permit authorizes the discharge. Because the focus on reducing pollutants was centered on industrial and sewage treatment discharges, Congress amended the CWA in 1987, requiring the USEPA to create phased NPDES requirements for storm water discharges.

In response to the 1987 Amendments to the CWA, EPA developed Phase I of the NPDES Storm Water Program in 1990. Phase I requires NPDES permits for storm water discharges from: (i) "medium" and "large" MS4s generally serving, or located in incorporated places or counties with, populations of 100,000 or more people; and (ii) eleven categories of industrial activity, one of which is construction activity that disturbs five acres or greater of land.

Phase II, adopted in December 1990 and scheduled to be in full effect in March 2003, requires operators of small MS4s and small construction sites (construction activity disturbing between 1 and 5 acres of land) in urban areas to control storm water runoff discharges. Phase II establishes a cost-effective approach for reducing environmental harm caused by storm water discharges from previously unregulated diffuse sources.

[1] *Report to Congress on Phase II Storm Water Regulations*. USEPA, Office of Water. EPA-833-R-99-001, Oct. 1999.

A. Basis for Permit Conditions

1. **Statutory basis for permit conditions.** The conditions established by this permit are based on Section 402(p)(3)(B) of the CWA which mandates that a permit for discharges from MS4s must: effectively prohibit the discharges of non-storm water to the MS4; and require controls to reduce pollutants in discharges from MS4 to the maximum extent practicable (MEP) including best management practices, control techniques, and system, design and engineering methods, and such other provisions determined to be appropriate. MS4s are not exempted from compliance with Water Quality Standards. Section 301(b)(1)(C) of the CWA requiring that NPDES permits include limitations, including those necessary to meet water quality standards, applies. The intent of the permit conditions is to meet the statutory mandate of the CWA.

   As authorized by 40 CFR 122.44(k), the permit will be utilizing BMPs, a comprehensive Storm Water Quality Management Plan (SQMP), as the mechanism to implement statutory requirements. Section 402(p)(3)(B)(iii) of the CWA clearly includes structural controls as a component of maximum extent practicable requirement.

2. **Regulatory basis for permit conditions.** As a result of the statutory requirements of the CWA the USEPA promulgated the MS4 Permit application regulations, 40 CFR 122.26(d). These regulations described in detail the permit application requirements for MS4s operators. The information in the Report of Waste Discharge (ROWD) was utilized to develop the permit conditions and determine permittees status in relationship to these conditions.

3. **Discharge limitations.** No numeric limitations are proposed at this time. In accordance with 40 CFR 122.44(k), the USEPA has required a series of increasingly more effective BMPs[1], in the form of a comprehensive SQMP, performance standards, in lieu of numeric limitations.[2]

B. Public Review and Participation Process

Since the Regional Board received the ROWD for Los Angeles County on January 31, 2001, Regional Board staff has dedicated significant time and effort to the public review and participation process. Many meetings, workshops, and other outreach efforts were organized to ensure that the public, the Permittees, and other interested parties had ample opportunity to participate in the development and comment on draft permit requirements and language prior to the proposed adoption by the Regional Board.

To invite public comment at the beginning of the renewal process, a preliminary draft, dated March 16, 2001, was issued to a working group of interested parties. This draft was used as a starting point for discussion. Recipients had approximately 30 days to review it prior to the issuance of the first draft, on April 13, 2001. The first draft was sent to all Permittees, storm water consultants, environmental organizations, and other

[1] *Interpretative Policy Memorandum on Reapplication Requirements* of MS4s issued by USEPA (61 Fed. Reg. 41697)
[2] *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits* (61 Fed. Reg. 43761)

interested parties. It was also available on the Regional Board Storm Water web page at www.swrcb.ca.gov/rwqcb4/html/programs/Stormwater/renewal.html. Again, more than one month was provided for the submittal of written comments. The renewal schedule also included the issuance of a second draft, followed by over 30 days for review and comments, and an additional 45 days between the issuance of the final draft and the proposed permit adoption, on October 25, 2001.

Furthermore, Regional Board staff conducted separate meetings to discuss each individual Special Provision as necessary. In addition to these meetings, Regional Board staff held two workshops to review the permit and listen to comments, including one formal workshop with the Board members. Regional Board staff also participated in the monthly Executive Advisory Committee meetings to answer questions and discuss permit issues. Staff was also available for public outreach via telephone. The following table outlines the public review process.

Date	Public Involvement Activity
January 31, 2001	Application for permit renewal (ROWD)
February 27, 2001	Inspections Working Group Meeting
February 28, 2001	Illicit Connection/Discharge Working Group Meeting
March 1, 2001	Monitoring Working Group Meeting
March 12, 2001	Public Information and Participation Working Group Meeting
March 20, 2001	Inspections Working Group Meeting
March 20, 2001	Construction Working Group Meeting
March 22, 2001	Preliminary Draft Working Group Meeting
April 9, 2001	Monitoring Working Group Meeting
April 13, 2001	Issuance of First Draft
April 24, 2001	Public Workshop
April 24, 2001	Construction Meeting with Building Industry Association
April 27, 2001	Monitoring Working Group Meeting
May 9, 2001	Monitoring Working Group Meeting
May 16, 2001	First Draft Comments Due
May 24, 2001	Construction Meeting with BIA
June 4, 2001	Monitoring Working Group Meeting
June 14, 2001	Monitoring Station Identification Field Trip
June 25, 2001	Monitoring Working Group Meeting
June 29, 2001	Issuance of Second Draft
July 26, 2001	Formal Workshop with Regional Board
September 7, 2001	Issue Final Draft
October 25, 2001	Proposed Permit Adoption at Board Meeting

IV. BACKGROUND - LOS ANGELES COUNTY MS4

A. Los Angeles County MS4 Permit History

In 1990, the Los Angeles Regional Water Quality Control Board (Regional Board) adopted Order No. 90-079, the Los Angeles County Municipal Storm Water Permit. That permit required the County of Los Angeles and the incorporated cities to implement pollution controls including amending ordinances, optimizing existing pollutant controls such as street sweeping, construction site controls, and others. The 1990 permit also required all Permittees to implement a minimum 13 BMPs for consistency across the County. The 1990 permit was issued on a system wide basis due to the highly interconnected storm drain system serving a population well in excess of 100,000 inhabitants. An NPDES permit is valid for a five-year period after the date is issued[1].

On July 15, 1996, the Regional Board adopted Order No. 96-054 that revised the 1990 permit. The 1996 permit required model programs be developed and implemented by the Permittees for Public Information and Public Participation, Industrial/Commercial Activities, Development Construction, Illicit Connections and Illicit Discharges, Public Agency Activities, and Development Planning. These dynamic model programs are modified with the changing needs of the SQMP.

Following the adoption of Order 96-054, the City of Long Beach submitted a ROWD as an application for its own MS4 permit. The City of Long Beach Municipal Storm Water Permit (Order No. 99-060) was adopted on June 30, 1999. This Order superseded the countywide permit, allowing Long Beach to operate under separate waste discharge requirements.

On January 31, 2001, the Los Angeles County Department of Public Works submitted an application for renewal of their MS4 permit in the form of an ROWD for Los Angeles County and the incorporated cities, except for the City of Long Beach. This application started the process of renewing the permit, which enters in its third cycle since the initial one was adopted in 1990.

B. Los Angeles County Storm Drain System

The storm drain system covered by this proposed permit for the County of Los Angeles and 83 incorporated cities drains the coastal slopes of the Transverse Mountain Ranges, and flows into the Santa Monica Bay and the Los Angeles/Long Beach Harbor. The storm drain structure consists of thousands of catch basins, thousands of miles of underground storm drains, as well as open channels, all owned and operated separately by Permittees. The length of the system, and the locations of all storm drain connections, is not known, as a comprehensive map for the storm drain system does not exist. Rough estimates, based on information from large municipalities (population > 100,000), indicates that the length exceeds 4,300 miles, as shown below.

[1] 40 CFR §122.46 (a)

Permittee	Area (Square Miles)	Catch Basins	Storm Drain Length	Open Channel Length
LA County		73,000	2,650 miles	450 miles
City of LA	469	30,000	1,600 miles	31 miles
El Monte	10	316	11 miles	0.4 mile
Glendale	30.6	1,100	Unknown	Unknown
Inglewood	9	1,157	12 miles	
Pasadena	26	1,050	30	
Santa Monica	8.3	850		
Torrance	20	2,000	20 miles	3 miles
TOTAL		**109,473**	**4,323**	**484.4**

C. Summary of Problems in the Los Angeles County Watersheds

Watersheds are geographic areas draining into a river system, ocean or other body of water through a single outlet. There are five Watershed Management Areas (WMAs) that represent the five major watersheds covered by the Los Angeles County MS4 NPDES permit. The following is a summary of some significant issues in each watershed.[1]

Dominguez Channel/Los Angeles-Long Beach Harbor Watershed

Permitted discharges

- 415 dischargers covered under an industrial storm water permit
- 69 dischargers covered under a construction storm water permit

Potential sources of pollution

- Historical deposits of DDT and PCBs in sediment
- Spills from ships and industrial facilities
- Leakages contaminating groundwater
- **Urban and storm water runoff**
- Impairments: metals, PCBs, PAHs, historic pesticides, coliform, trash, and nitrogen

Los Angeles River Watershed

Permitted discharges

- 1,327 dischargers covered under an industrial storm water permit

[1] *Watershed Management Initiative Chapter*. California Regional Water Quality Control Board – Los Angeles Region. Dec. 2000.

- 147 dischargers covered under a construction storm water permit

Potential sources of pollution

- Nitrogen and coliform contributions from septic systems
- Other nonpoint sources (horse stables, golf courses)
- Leakage of MTBE from underground storage tanks
- **Urban and storm water runoff**
- Impairments: nitrogen, trash, selenium, other metals, coliform, PCBs, historic pesticides, chlorpyrifos

San Gabriel River Watershed[1]

Permitted discharges

- 549 dischargers covered under an industrial storm water permit
- 175 dischargers covered under a construction storm water permit

Potential sources of pollution

- Excessive trash in recreational areas of upper watershed
- Nonpoint source loadings from nurseries and horse stables
- **Urban and storm water runoff**
- Impairments: nitrogen and effects, trash, metals, historic pesticides, coliform, chlorides, and PCBs

Santa Monica Bay Watershed

- 549 dischargers covered under an industrial storm water permit
- 175 dischargers covered under a construction storm water permit

Potential sources of pollution

- Discharges from Ballona and Malibu Creeks contribute to impairments in the Santa Monica Bay and its beaches.
- Impairments: mercury, selenium, other metals, historical pesticides, PAHs, PCBs, nitrogen, coliform, trash, TBT, habitat alteration, exotic vegetation, and salts

Coastline

- **Acute health risk associated with swimming in runoff contaminated surfzone waters**
- Chronic risk associated with consuming seafood from areas impacted by DDT and PCB contamination
- Historic deposits of DDT and PCBs in sediment

Ballona Creek Watershed

- Trash loading from creek

[1] *San Gabriel Watershed State of The Watershed* - RWQCB - LA Region - June 2000

- Sediment contamination by heavy metals form creek to Marina del Rey Harbor and offshore
- **Toxicity of both dry weather and storm water runoff in creek**
- High bacterial indicators at mouth of creek

Malibu Creek Watershed

- Excessive freshwater, nutrients, and coliform in lagoon; contribution from POTW and other sources
- **Urban runoff from upper watershed**
- Septic tanks in lower watershed

V. DISCUSSION OF SPECIAL PROVISIONS

A. Public Information and Participation Program (PIPP)

Legal Authority:

CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(I)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) provides that the proposed management program include "A description of a program to reduce to the maximum extent practicable, pollutants in discharges from MS4s associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(6) provides that the proposed management program include " A description of education activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."

To satisfy the Public Education and Outreach minimum control measure, the Permittees need to: (i) implement a public education program to distribute educational materials to the community, or conduct equivalent outreach activities about the impacts of storm water discharges on local waterbodies and the steps that can be taken to reduce storm water pollution; and (ii) determine the appropriate BMPs and measurable goals for this minimum control measure.

Background:

Implementation of a PIPP is a critical BMP and a necessary component of a storm water management program. The State Board Technical Advisory Committee "recognizes that education with an emphasis on pollution prevention is the fundamental basis for solving nonpoint source pollution problems." The USEPA Phase II Fact Sheet 2.3 (Fact Sheet 2.3) finds that "An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the

public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters."[1]

Furthermore, the public can provide valuable input and assistance to a municipal storm water management program and, therefore, should play an active role in the development and implementation of the program. An active and involved community is essential to the success of a storm water management program because it allows for:

- Broader public support since citizens who participate in the development and decision making process are partially responsible for the program and, therefore, may be less likely to raise legal challenges to the program and are more likely to take an active role in its implementation;
- Shorter implementation schedules due to fewer obstacles in the form of public and legal challenges and increased sources in the form of citizen volunteers;
- A broader base of expertise and economic benefits since the community can be a valuable, and free, intellectual resource; and
- A conduit to other programs as citizens involved in the storm water program development process provides important cross-connections and relationships with other community and government programs. This benefit is particularly valuable when trying to implement a storm water program on a watershed basis, which is encouraged by the USEPA.

Discussion:

Based on the background information, the County should continue its comprehensive educational storm water and urban runoff outreach program, which is designed to measurably increase public knowledge and change behavior regarding storm water pollution. The first five-year public education plan was successful at studying segmentations of Los Angeles County residents to identify those who pose the greatest threat to storm water quality and those who represent the greatest opportunity to respond to a public education program, as well as providing a baseline measurement of residents' storm water-related practices and habits. This information was used to target the residents who are most likely to change their behaviors to improve storm water quality. Using various communication tactics and activities, the program successfully reached 83% of County residents with pollution prevention messages through the Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis (Five-Year Strategy).[2]

Although the Program has been successful at certain goals it must be augmented to continue increasing public awareness of specific storm water issues. According to the USEPA, materials and activities should be relevant to local situations and issues, and incorporate a variety of strategies to ensure maximum coverage. This is addressed in Part P.4 of the Five-Year Strategy by

[1] *Storm Water Phase II Final Rule - Public Education and Outreach Minimum Control Measure.* USEPA Fact Sheet 2.3, January 2000.

[2] *Storm Water/Urban Runoff Public Education Program Five-Year Storm Water Public Education Strategic Analysis*, Los Angeles County of Public Works, July 31, 2000.

requiring the development of watershed and pollutant-specific education programs.

Also, the USEPA encourages partnerships and cooperation, and quarterly meetings will provide the opportunity for Permittees to coordinate their outreach efforts and efficiently build on the County's existing program with local, watershed-specific efforts.

Furthermore, "Directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts is recommended" (Fact Sheet 2.3). The Permittee conducted educational site visits to Phase I industrial facilities, auto repair shops, retail gasoline outlets, and restaurants during the last 5-year permit cycle. The next step in this targeted outreach program is education at the corporate level to facilitate employee compliance, as described in Part P.5 of Five-Year Strategy. Also, a non-regulatory business assistance program will encourage small businesses that lack access to the expertise necessary to comply with storm water regulations to implement pollution prevention measures.

Specific significant changes in the draft permit and their justifications are described below:

1. Program for Residents

NEW REQUIREMENT: The Principal Permittee shall organize Public Outreach Strategy meetings with all Co-permittees on a quarterly basis. The Principal Permittee shall provide guidance for Co-permittees to augment the regional outreach and education program. Co-permittees shall coordinate regional and local outreach and education to reduce duplication of efforts.

JUSTIFICATION: This requirement is based on the need for coordination between all Permittees. Since the Program's inception, Permittees have been required to conduct education activities within their own jurisdictions. The lack of guidance and coordination has led to duplicate efforts and confusion about developing appropriate programs that are consistent with, and enhance, the Principal Permittee's regional education program. This requirement will ensure that all Permittees are coordinated for the most efficient and effective Program. It will also help identify Permittees with insufficient Programs.

Fact Sheet 2.3 states that it is generally more cost-effective to have numerous operators coordinate to use an existing program than all developing their own local programs. Therefore, Permittees should build on the regional program with additional information specific to local needs.

NEW REQUIREMENT: The Principal Permittee and Co-permittees shall coordinate to develop outreach programs that target the watershed-specific pollutants listed in Table 1 within 6 months of the permit adoption date. It may be appropriate to address metals in the Industrial/Commercial businesses program. Region-wide pollutants may be included in the Principal Permittee's mass media efforts.

Table 1. Target Pollutants for Outreach

Watershed	Target Pollutants for Outreach
Ballona Creek	*Trash, Indicator Bacteria, Metals, PAHs*
Malibu Creek	*Trash, Nutrients (Nitrogen), Indicator Bacteria*
Los Angeles River	*Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs*
San Gabriel River	*Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals*
Santa Clara River	*Nutrients (Nitrogen), Indicator Bacteria*
Dominguez Channel	*Trash, Indicator Bacteria, PAHs*

JUSTIFICATION: This requirement will allow the Program and/or local efforts to focus on target pollutants. Citizens must be aware of priority pollutants and their causes for any improvement to occur. Page 3 of the SQMP states that the components within the phases that roll-out over the next four years will be fluid to reflect the evolving message for each targeted audience. This implies that the Permittee realizes the need to target pollutants and specific audiences and has already planned to address this issue. This is a necessary step in the implementation of current and future total maximum daily loads (TMDLs) requirements.

Fact Sheet 2.3 states that municipalities should strive to make their materials and activities relevant to local situations and issues, and to incorporate a variety of strategies to ensure maximum coverage. It also recommends directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts.

Although it may not be appropriate to target heavy metals through the Program for Residents, it may be accomplished through the site inspection program. The Industrial/Commercial Program will prioritize facilities by their threat to water quality and whether or not they generate pollutants for which the water body is impaired, so it will be consistent with this requirement and Table 1.

2. Programs for Businesses

NEW REQUIREMENT: The Principal Permittee shall develop and implement a Corporate Outreach Program to educate corporate environmental managers about storm water regulations. The Program shall target retail gasoline outlets (gas stations) and restaurant chains.

JUSTIFICATION: Facility owners and representatives at the corporate level are not typically present during site visits or inspections. They need to be educated about applicable storm water regulations so they can set rules and direct management to ensure compliance at the facility level.

This has already been discussed as the next step following the last five years of outreach to these businesses.

NEW REQUIREMENT: Permittees may develop and implement a Business Assistance Program to provide technical resource assistance to small businesses to help them understand and comply with storm water regulations.

JUSTIFICATION: Many small businesses do not have the resources or expertise necessary to understand and implement storm water regulations. And hiring consultants and implementing structural BMPs can put many small operators out of business. Therefore, a non-regulatory assistance program that educates businesses about pollution prevention will help them comply, and cut costs, so they can continue to be competitive. This is encouraged, but is not a requirement.

The City of Los Angeles has been implementing a successful business outreach program through the Hazardous and Toxic Materials Office since 1988.

Fact Sheet 2.3 recommends directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts.

Alternative funding sources, such as grants and loans may be available to fund such a program.

3. Performance Standards

NEW PERFORMANCE STANDARD: The discharger shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water via print, local TV access, local radio, or other appropriate media.

JUSTIFICATION: According to the Principal Permittee's Year Four (1999-2000) Highlights, approximately 85 million impressions were made through advertising, media relations, customized coffee jackets, corporate partnerships, special events, and business outreach. Hits on the www.888CleanLA.com website have been consistently increasing, indicating a growing public interest, as well as greater impressions. It can be anticipated that mass media coverage will become more efficient after the final Program study is complete in the summer of 2001. Also, increased media attention and public interest in current issues, such as trash TMDLs, is expected. The County originally proposed that it would make a minimum of 50 million impressions per year; however, this number has been reduced to 35 due to the increasing cost of advertising.

The requirement is consistent with the number of impressions required in the City of Long Beach Municipal Storm Water Permit Order (99-060) and the Ventura County Municipal Storm Water Permit. The City of Long Beach is required to make a minimum of 1.5 million impressions per year. With a total population of approximately 426, 000 people, they must impress each person approximately 3.5 times per year. Ventura County is also required to impress every resident approximately 3 times. The 9.5 million people in Los Angeles County[1] must be impressed approximately 3 times per year.

[1] 2000 U.S. Census Bureau

NEW PERFORMANCE STANDARD: The discharger shall provide all School Districts within its jurisdiction with materials, including videos, live presentations, brochures, and other media necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution. All Co-permittees shall cooperate with funding and implementing this requirement. Cooperative efforts with other agencies may also be used to accomplish this requirement.

JUSTIFICATION: This requirement is consistent with the City of Long Beach Municipal Storm Water Permit.

It is also justified by the performance of Los Angeles County's School Environmental Education Program. According to data provided by the County, the Program has been reaching approximately 50 percent of elementary and secondary schools in the County every 2 years. It is also expected that the required coordination among permittees will increase the effectiveness and range of this Program.

NEW PERFORMANCE STANDARD: Corporate Outreach for all gas station and restaurant chain corporations shall occur once every 2 years, not less than twice during the permit cycle.

JUSTIFICATION: This performance standard is required because it is consistent with the frequency of previous and current inspections. This program will replace the need for educational site visits or inspections of gas stations. The resources saved by not inspecting gas stations can be used to fund this program. Also, a corporation can encompass many gas stations or restaurants, so the number of consultations will be significantly less than that of previously required educational site visits.

B. Industrial/Commercial Facilities Program

Legal Authority:

The Phase I 40 CFR 122.26(d)(2) regulations require, in part, that the applicant (i) develop adequate legal authority, (ii) perform a source identification, and (iv) develop a management program to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system design and engineering methods, and such other provisions which are appropriate. Specifically, with regards to industrial controls, the management plan shall include the following.

40 CFR 122.26(d)(2)(iv)(C), A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and **industrial facilities** that the municipal permit applicant determines are **contributing a substantial pollutant loading to the municipal storm sewer system**. The program shall:

*(1) Identify priorities and procedures for **inspections** and **establishing and implementing control measures** for such discharges;*

*(2) Describe a **monitoring program** for storm water discharges associated with industrial facilities [...]*

Background:

The municipality is ultimately responsible for discharges from their municipal storm sewer system (MS4). Because industrial awareness of the program may not be complete, there may be facilities within the MS4 area that should be permitted but are not (non-filers). In addition, the Phase I regulations that require industries to obtain permits is based on SIC Code. This has been shown to be incomprehensive in identifying industries that may be significant sources of storm water pollution (*by industries we also mean commercial businesses. "Industries" is intended as a generic term*) that should be permitted. Another concern is that the permitting authority **may not have adequate resources** to provide the **necessary oversight** of permitted facilities. Therefore, it is in the municipality's best interest to assess the specific situation and implement an industrial/commercial inspection/site visit and enforcement program to control the contribution of pollutants to and through their MS4 to the maximum extent practicable from all high risk sources.

In the preamble for its 1990 regulations, the USEPA clearly states the intended strategy for discharges of storm water associated with industrial activity: *"...Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that **controls** be placed on **storm water discharges associated with industrial activity** which discharge through the municipal system."* The USEPA also notes in the preamble that *"... municipalities will be required to meet the terms of their permits related to industrial dischargers."*

In the Chapter 3.0 of the USEPA's Guidance Manual[1], it is specified that municipal applicants must demonstrate that they possess adequate legal authority to:

- Control construction site and other **industrial discharges** to MS4s;
- Prohibit illicit discharges and control spills and dumping;
- Carry out **inspection, surveillance, and monitoring** procedures.[1]

The document goes on to explain that **"control"**, in this context means not only to require disclosure of information, but also to **limit, discourage, or terminate** a storm water discharge to the MS4. Also, to satisfy its permit conditions, a municipality **may need to impose additional requirements on discharges from permitted industrial facilities, as well as discharges from industrial facilities and construction sites *not* required to obtain permits.**

In the same Guidance Manual, Chapter 6.3.3, it is stated that the municipality is ultimately responsible for discharges from their MS4. Consequently, the proposed storm water management program should describe how the municipality **will help** the USEPA and authorized NPDES States to:

- **Identify** priority industries discharging to their systems;

[1] *Guidance Manual For the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems* - USEPA -November 1992

- **Review and evaluate** storm water pollution prevention plans (SWPPPs) and other procedures that industrial facilities must develop under general or individual permits;
- **Establish and implement** BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- **Inspect and monitor** industrial facilities discharging storm water to the municipal systems to ensure these facilities are in compliance with their NPDES storm water permit, if required.

Discussion:

Recognizing that the municipality is ultimately responsible for the quality of storm water discharges in the MS4, the municipalities should evaluate the industrial/commercial facilities and determine their compliance with the permit requirements, as well as their contribution to the MS4 and potential impacts to the receiving waters. The following areas must be addressed in order to implement a meaningful industrial/commercial inspection/site visit and enforcement program, which has the ability to **control and reduce** the contribution of pollutants from industrial/commercial sites to the MEP.

- **Source Identification**
  - Identification of industrial/commercial sites discharging to the MS4 (by SIC codes and narrative if needed)
  - Characterization of activities, materials used, and potential for contributing pollutants along with the type of pollutants

- **Pollution Prevention**
  - Key concepts are many times overlooked: **Prevent, before it happens**, and be **Pro-active** rather than **Reactive**. It is more difficult to treat after the pollutant is released or mixed with runoff. BMPs and other site-specific controls are often most appropriate for reducing pollutants in storm water discharges associated with industrial activity.

- **Threat to Water Quality Prioritization**
  - Identify impaired water bodies and link with activities and industrial/commercial sites that may contribute specific pollutants creating (or potentially contributing to) the water quality impairment

- **Through existing ordinance, order, or similar means, the ability to**
  - enter premises;
  - conduct inspections;
  - review and evaluate SWPPPs;
  - require minimum BMP implementation and monitoring results review; and,
  - take appropriate enforcement procedures and actions

  in order to address the following elements:

  - minimum BMP Implementation
  - monitoring of Industrial/Commercial sites
  - inspection/site visit of Industrial/Commercial sites
  - enforcement measures for Industrial/Commercial sites

It may be necessary to update existing ordinances if they do not provide sufficient legal authority to implement the above mentioned components.

Strategy and Coordination with State activities

Recognizing the dual coverage envisioned by the USEPA regulations, and suggested partnership between local and State authorities, municipalities shall coordinate with State activities for the implementation of the General Industrial Activities Storm Water Permit (GIASP) and the control of other sources not specifically covered under Phase I storm water regulations but identified as significant contributors of pollutants by the municipalities through their identification and prioritization process. The net result should be a better and improved coordinated program with greater impact on limiting and eliminating (as a final goal) the contribution of pollutants to the receiving water while maintaining and/or restore the capacity of the receiving water to sustain the beneficial uses without impairments.

During the previous permit cycle the Los Angeles County conducted a Critical Source Study (1998-2000) as required by the permit conditions. The objective of the study was to identify five priority industrial and/or commercial critical source types, and monitor each source type for two years. The *Critical Source Selection and Monitoring Report* (Woodward-Clyde, 1997) identified as the five highest ranked pollution potential activities to be, in order of ranking: (i) wholesale trade (scrap, auto dismantling), (ii) automotive repair/parking, (iii) fabricated metal products, (iv) motor freight (including trucking), (v) chemical and allied products. The report also outlined a complete study plan to be implemented by the Permittees during the permit cycle. It is significant to note that four out of five categories of activities are subject to Phase I storm water regulations while automotive repair/parking category was not the focus of Phase I, but the study identified this category as a significant contributor based on the criteria developed in the report.

Rank (pollution potential)[1]	Industrial Category	SIC Code	No. Facilities
1	Wholesale trade (scrap, auto dismantling)	50	587
2	Automotive repair/parking	75	6,067
3	Fabricated metal products	34	3,283
4	Motor freight (including trucking)	42	872
5	Chemical and allied products	28	1,069

Based on the dual coverage and partnership approach between permitting authority and municipalities intended by the USEPA in the storm water regulations (see letters from Alexis Strauss, USEPA Water Division Director)[2,3], and in order to best use limited resources at the State and Municipal level, Regional Board staff requires the following improvements:

Recognizing that this permit represents a third generation permit, and building upon the experience and tools developed under the previous permits, the Industrial/Commercial program must be elevated to an Inspection/Site visits and

[1] *Critical Source Selection and Monitoring Report (Table 1-3)* - Woodward-Clyde 1996
[2] Letter dated December 19, 2000, from Alexis Strauss, Director, Water Division, USEPA Region IX, to Dennis Dickerson, Executive Officer, Regional Water Quality Control Board-Los Angeles Region.
[3] Letter dated April 30, 2001, from Alexis Strauss, Director, Water Division, USEPA Region IX, to Honorable Stephen Horn, U.S. House of Representatives

enforcement program, in order to have the municipalities control the storm water discharges associated with industrial activities from industrial/commercial facilities to the MEP while assisting the Regional Board to implement the general permit for industrial activities. The business PIPP component should be continued under the auspices of the Public Education program.

The strategy as outlined in the permit builds on the State/Municipalities partnership by focusing their limited resources on the following activities:

- The Permittees will take a lead role in inspecting restaurants, automotive service facilities and site visits at Phase I facilities while
- Regional Board will be the lead for facilities covered or in need of coverage under GIASP
- The Permittees will assist Regional Board in its activities to fully implement the GIASP through spot check inspections, referrals, data information search, joint inspections
- The Regional Board and Permittees will coordinate their informational systems and task scheduling to avoid duplication and strengthen harmonization of activities

C. Construction Sites Program

Legal Authority:

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D) provides that a proposed management program must include "A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system."

In this Permit renewal, Regional Board staff have drafted language that provides more consistency among the Permittees and that distinguishes among the different types and sizes of construction activity that occur within our Region.

Background:

There are different environmental impacts of construction activity.

As stated in the *California Storm Water Best Management Practice Handbook for Construction Activity* (BMP Handbook), "Construction usually increases the amount of impervious area causing more of the rainfall to runoff, and increasing the speed at which runoff occurs. Unless properly managed, this increased runoff will erode natural and/or unprotected watercourses causing the watercourse to widen...Sedimentation can also contribute to accelerated filling of reservoirs, harbors, and drainage systems.[1]

Discussion:

The prevention of erosion is a key objective to the proposed modifications to the construction program under this draft Order. The Permittees currently oversee

[1] *California Storm Water Best Management Practice Handbook for Construction Activity.* 1993

construction sites within their respective jurisdiction. The oversight of smaller construction sites (those sites under five acres) is inconsistent among Permittees. Some Permittees have incorrectly assumed that responsibility begins only after a discharge of pollutants, sediments for example, has left the site. This was not intended in either the Phase I Federal Regulations promulgated on November 16, 1990, or in Board Order 96-054. In this permit reissuance, Regional Board staff proposes to eliminate these inconsistencies and require that the municipalities better coordinate oversight of construction activity within their jurisdiction. The Permittees are ultimately responsible for what enters and exits the portion of the storm drain system that they own and/or operate. It is in the best interest of the Permittees to become familiar with what enters their system and to control as necessary the discharges allowed into their storm drain system.

Specific significant changes in the draft permit and their justifications are described below:

NEW REQUIREMENT: Regional Board staff propose that the Permittees implement requirements for the use of effective erosion and sediment controls at construction sites regardless of size, wherever applicable.

JUSTIFICATION: The need for proper erosion and sediment controls is very apparent during, and immediately after, the rains that we experience in Southern California. The environmental effects of erosion are well documented and erosion is something that can be prevented or reduced with the proper foresight and implementation of suitable BMPs.

NEW REQUIREMENT: Requirements for structural source control and non-structural BMPs for controlling runoff at construction sites.

JUSTIFICATION: The need to properly control runoff at construction sites is great. When erosion occurs the sediments generated begin to flow down hill. With adequately engineered and implemented structural or non-structural BMPs, the detrimental environmental effects can be eliminated or minimized. Currently, there are many manuals and guidance handbooks available to lead a developer. The municipalities, in general, are aware of these BMPs, and working with Regional Board staff facilitates the requirements being quickly implemented.

NEW REQUIREMENT: Each Permittee shall require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP), or compliance with a minimum set of BMPs for construction sites of less than 1 acre.

JUSTIFICATION: This requirement is intended to bring the smaller sites into environmental compliance by requiring the implementation of erosion and sediment control or pollution prevention BMPs on smaller sites that other wise would potentially not have any requirements for pollution control. This, however, does not necessarily require that a permit be issued to the small site operator.

NEW REQUIREMENT: Each Permittee shall require the preparation, submittal, and implementation of a Local SWPPP prior to issuance of a grading permit for construction projects that meet one or more of the following criteria: will result in soil disturbance of one acre or more in size; is within, directly adjacent to, or is

discharging directly to an environmentally sensitive area; or is located in a hillside area.

JUSTIFICATION: This is to ensure that a site that is being graded, but is less than the size requirements for a General Construction Activities Storm Water Permit (GCASP) have oversight by the local permitting authority. Currently, there are inconsistent requirements for grading among the Permittees and this change would bring consistency and environmental protection for smaller sites conducting grading activities.

NEW REQUIREMENT: The Permittees shall have a mechanism to review, approve, and enforce any erosion control plan submitted to the Permittee for implementation at construction sites within the legal boundary of the Permittees jurisdiction, regardless of size and regardless of whether a GCASP exists for the sites. This mechanism shall be available through the requirement of Local SWPPPs on projects within the Permittees jurisdiction of one acre or more.

JUSTIFICATION: The Permittees need to take an active role in what the operators of construction sites are doing to prevent erosion and not wait for the detrimental effects of a rain on a site with inadequate erosion controls and the flow of sediments off site to react with an enforcement action.

NEW REQUIREMENT: The Permittees, on those sites that need a GCASP shall not issue a grading permit until such time that the Notice of Intent (NOI) to comply with the State Permit and a copy of the SWPPP is submitted to the local authority. This also applies to property transfers between developers.

JUSTIFICATION: This is currently a requirement in Board Order No. 96-054, but not all Permittees have completely or consistently implemented this. Regional Board staff inspect construction sites covered by a GCASP. The Permittees are optimizing the implementation of the State Permit when they implement this requirement. Regional Board staff has found that on occasion, a Permittee issues a grading permit where no state permit has been obtained. State-municipal coordination reduces the amount of sites that Regional Board staff inspects for State requirements. With this requirement fully implemented, Regional Board staff believe that the number of construction sites covered by a State Permit will increase from approximately 1000 to 1500, solely as a result of consistency among the Permittees in issuing grading permits.

NEW REQUIREMENT: Wet weather inspections are required of all construction sites one acre or greater. The Permittees need to conduct wet weather inspections to ensure compliance with local ordinances.

JUSTIFICATION: If all sites are inspected, this allows the Permittees to ascertain compliance and focus educational and enforcement efforts on those that most need it. Additionally, Regional Board staff can assist the Permittees in compliance oversight by conducting joint inspections. The City of Los Angeles estimates that there will be an increase of 15,000 sites. As this is the largest Permittee it is anticipated that this new requirement will not be as burdensome on the rest of the Permittees. Nonetheless, these inspections will be essential to reducing the discharge of pollutants to waters of the United States to the maximum extent practicable.

D. Illicit Connections and Illicit Discharges Elimination Program

Legal Authority:

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) provides that the proposed management program "shall be based on a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) provides that the Copermittee include in its proposed management program "a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system."

Background:

During dry weather, much of the discharge to storm drain systems consists of wastes and wastewater from non-storm water sources. A significant amount of such discharges may be from illicit discharges or connections, or both. Illicit discharges may occur either through direct connections, such as deliberate or mistaken piping, or through indirect connections, such as dumping, spillage, subsurface infiltration, and washdowns.

The objective of a municipality's illicit connection/illicit discharge (IC/ID) elimination program should be to detect illicit connections and illicit discharges to the storm drain system, and to promptly eliminate such discharges and connections. Municipalities typically employ the approaches listed below to achieve this objective:

1. Mapping locations of outfalls of the MS4 and the names and locations of all waters of the U.S. that receive discharges from the outfalls.
2. Adopting a storm water/ urban runoff ordinance to prohibit unauthorized non-storm water discharges into the MS4, and implementing appropriate enforcement procedures and actions.
3. Implementing a program to detect and eliminate non-storm water discharges to the MS4, including illegal dumping.
4. Educating public employees, businesses, and the general public about the dangers associated with illegal discharges and improper disposal.
5. Establishing a public reporting hotline or other mechanism to report illicit discharges and illegal dumping.
6. Establishing measurable goals to evaluate successful program implementation.

Discussion:

Existing IC/ID Elimination Program

The Regional Board approved a model IC/ID elimination program for the Permittees' SQMP on March 23, 1999. Only vague performance standards are specified in this model program. By July 1999, all Permittees reported that they implemented this program. Permittees' estimates of fiscal resources required to implement their programs ranged widely, with two cities, Culver City and Hermosa Beach, estimating expenditures of $4.2 million and $2.8 million, respectively. At the other end, four cities estimated $0 expenditures, namely La Habra Heights, Lawndale, Maywood (which does not operate a storm drain system), and West Covina. Based on the Permittees' estimates of expenditures, the Permittees expended an average of $113,900 in 1999/00. Removing the anomalous estimates for Culver City and Hermosa Beach, the high ranges up to $564,809, as estimated by the City of Los Angeles, and averaged $32,500.

The Permittee's IC/ID activities are summarized in Tables 1 through 12. The reports of suspected illicit discharges and connections, as summarized in the tables, do not appear to bear a relationship with IC/ID expenditures by each Permittee.

Illicit Connections: As designed in the model program, Permittees with storm drain systems under their management rely upon field screening, during regularly scheduled maintenance of the storm drain system, to locate illicit connections. However, most Permittees cannot estimate the length of the storm drain system that was field-screened; nor did the Regional Board require reporting such information.

For the 1999/00 annual reporting period, very few Permittees reported illicit connections. The attached tables show that the numbers of illicit connections varied widely among Permittees, with about half reporting no illicit connections, and with the County reporting 877 suspected illicit connections. Part of the reason for this range is that the County is responsible for maintaining over half[1] of the storm drain system. Also, several Permittees believe that few – if any – illicit connections have been identified in many cities because: (a) many cities are primarily residential, and illicit connections are unlikely to occur from residential land use; and (b) cities in the County of Los Angeles are relatively new vis a vis their eastern counterparts, and adequate controls were in place at the time storm drain connections were installed.

Illicit Discharges: As designed in the model program, Permittees eliminate illicit discharges by preventing spills and, for those that do occur, by responding promptly. To prevent spills, Permittees enacted ordinances prohibiting non-storm water runoff, and are following spill prevention guidance. To respond to discharges, Permittees implement containment and cleanup procedures, coordinate with other agencies, investigate the cause of the discharge and – when the source and responsible party is know – take enforcement action. Additionally, employee training is provided on all of the above.

As with illicit connections, the numbers of illicit discharges varies widely for the annual reporting period 1999/00. The County reported a total of 788 suspected illicit discharges. Among the Cities, results at the high end include 1,876 in the

City of Los Angeles, 700 in the City of Beverly Hills, and 450 in Santa Monica. At the other end of the range, many cities reported no incidents of suspected illicit discharges. Based on information provided to date, staff cannot account for this wide range. Audits of the Permittees' programs should help clarify this.

Reporting: As designed in the model program, Permittees have implemented procedures to receive reports of illicit discharge and disposal incidents, and to promptly respond and report such incidents. Most rely upon the countywide hotline system, which is maintained by the County. For hazardous substances, Permittees implement additional reporting procedures.

Proposed IC/ID Elimination Program

The Special Provisions Section of the proposed permit requires the Permittees to revise their IC/ID Elimination Program in the SQMP within 180 days of adoption. As specified in the proposed permit, the key revision to the IC/ID Elimination Program shall include a proactive screening program for illicit discharges in priority areas. As Permittees have pointed out, and as staff acknowledges, residential land uses are less likely to have illicit connections. However, staff remains concerned that adequate controls have been in place at all times for proper connections to the storm drain system. Staff's concern is based upon the wide range of illicit connections reported by Permittees with no apparent relation to land use, and also incidents of illicit connections reported separately to the Regional Board. Accordingly, the proposed permit specifies that the Permittees shall revise the SQMP to evaluate illicit connections, prioritize suspected problem areas, and implement a proactive field screening program for such areas (that does not rely upon screening during Permittees' regularly scheduled maintenance of the storm drain system). As set forth on page 3-3 and in Appendix I of the Permittees' model program, screening tools for the proactive program will include dye tests, smoke tests, and TV inspections.

E. Public Agency Activities Program

Legal Authority:

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A)(1,3,4,5,and 6). Each Copermittee must develop a program to reduce the discharge of pollutants to and from the MS4 to the maximum extent practicable for all urban land uses and activities, including municipal areas and activities.

Background:

Many Permittees conduct activities that ultimately result in the enhancement of the lives of the residents of the cities in which they live. Some of these activities include but are not limited to: sewage system operations; public construction activities; vehicle maintenance; material storage; street and road maintenance; landscaping; recreational facility management; parking facility management; public industrial activities; and many other activities. These are essential services that unfortunately have potential side effects, albeit they are preventable or treatable. The Permittees also conduct some activities that are required to have separate coverage under the 1990 storm water regulations. These services or

activities undertaken by the Permittees, or by their contractors, sometimes mirror industrial activities and construction activities that a Permittee would actually place requirements upon, if the work were undertaken by and for a private party. The changes proposed by Regional Board staff are to bring consistency to requirements in this draft permit so that the end effect is pollution prevention.

Specific significant changes in the draft permit and their justifications are described below:

NEW REQUIREMENT: In sewage system operations, the proposed change is that each Permittee will be required to implement a response plan in case of an overflow of the sewage system to the storm drain system.

JUSTIFICATION: The response plan will have different requirements dependent upon whether the Permittee neither owns nor operates or maintains the sewer system to whether the Permittee owns and operates the sewer system. Because the responsibilities are different, the expectations of the Regional Board should therefore be different and the proposed language reflects this.

NEW REQUIREMENT: In public construction activity management, the proposed changes include generally, that the requirements in the construction section of the draft permit also apply to the Permittees public construction sites.

JUSTIFICATION: This is proposed to reduce the possibility of a public construction site from becoming a source of pollutants. A public construction site should be a model of what to do efficiently and effectively.

NEW REQUIREMENT: Each Permittee with a construction site that meets the size requirements for a GCASP shall obtain a permit from the State for the construction activity. Currently the size threshold is 5 acres but will change to 1 acre on March 10, 2003. However, a municipality of less than 100,000 people need not apply for the state permit for a construction activity until March 10, 2003.

JUSTIFICATION: This change is for consistency and will assist in the tracking of construction sites operated by Permittees.

NEW REQUIREMENT: For each Permittee owned construction site, the Permittee shall inspect and replace any ineffective BMPs when found.

JUSTIFICATION: This is to ensure that a properly designed and implemented BMP is properly maintained and is in proper working order during rains.

NEW REQUIREMENT: Each Permittee will be required to design and construct public facilities using construction and post-construction BMPs consistent with the Standard Urban Storm Water Mitigation Plans (SUSMPs) required under the Construction Planning section of the draft permit.

JUSTIFICATION: This is to be consistent with private projects and their planning, design, and construction requirements.

NEW REQUIREMENT: For Permittee owned or operated vehicle maintenance, material storage areas, and corporation yards the Permittees will implement site

specific SWPPPs to minimize pollutant discharges in storm water discharges. Vehicle and equipment wash areas will be required to be self contained or covered, equipped with a clarifier, or other pretreatment device, and or properly connected to the sanitary sewer. This requirement will take effect when a new facility is constructed or when an existing site is remodeled or reconstructed.

JUSTIFICATION: This is to be consistent with private projects and their planning, design, and construction requirements.

NEW REQUIREMENT: For landscape and recreational facilities the changes proposed include the handling and storage of materials under cover, or on secondary containment, and the inspection of such areas.

JUSTIFICATION: These changes are minimal, and simply reflect good house keeping practices that are easily and inexpensively made.

NEW REQUIREMENT: For storm drain operation and maintenance the changes proposed are the inspection and clean out of catch basin inlets between May 1 and September 30 of each year, and the classification of priority catch basins as those 40% or more full for additional cleaning between October 1 and April 30.

JUSTIFICATION: This is to be consistent with the Ventura County Municipal Storm Water Permit.

NEW REQUIREMENT: The Permittees shall keep records of catch basins cleaned and record overall quantity of wastes collected.

JUSTIFICATION: This change is a tool to assist the Permittees in tracking cleaning and amounts of wastes collected that can also be reported to the public and to federal and state agencies as to what was prevented from flowing to waters of the U.S.

NEW REQUIREMENT: For storm drain maintenance each Permittee must visually monitor their open channels for debris and identify and prioritize areas of illicit discharge for regular inspection and at least annually remove trash and debris from the channels. Permittees will review existing maintenance activities. After clean out, the material will be properly disposed of.

JUSTIFICATION: The annual clean out is a continuation of the 1996 Permit but the visual monitoring is a new requirement to assist the Permittees in prioritizing clean outs and mobilizing cleaning crews.

NEW REQUIREMENT: For street and road maintenance each Permittee will conduct street sweeping on curbed public streets in their permitted area at a monthly average, not less than four times per month, in areas generating high volumes of trash, and at a monthly average not less than two times per month in areas generating moderate volumes of trash on traffic collector streets and residential areas (except that for any Permittee within an area subject to a trash TMDL, the Permittee may implement a program which maximizes trash removal by using an effective combination of street sweeping, catch basin clean outs, installation of treatment devices, and/or implementation of any other BMPs that achieve waste load allocations).

JUSTIFICATION: The changes in frequency are to be consistent with the Ventura County Municipal Storm Water Discharge Permit. The language pertaining to complying with a TMDL Waste Load Allocation (WLA) is new and was created to provide the Permittees subject to TMDLs flexibility in complying with both the TMDL and this Order. By complying with the TMDL, the Permittee will be complying with this Order as it pertains to the listed sections only.

NEW REQUIREMENT: Permittee-owned parking lots shall be kept clear of debris and oil buildup and cleaned no less than two times per month and/or inspected no less than two times per month to determine if cleaning is necessary.

JUSTIFICATION: The proposed change is to require the inspection of the lots and to clean them when necessary. The proposed cleanup of oil spots and debris is to keep lots from becoming significant sources of pollutants.

NEW REQUIREMENT: Each Permittee shall require that sawcutting wastes be recovered and disposed of properly and that in no case shall waste be allowed to enter the storm drain.

JUSTIFICATION: Previously the requirement was that sawcutting not occur during a rain except by emergency. This requirement provides flexibility in implementation of BMPs with the ultimate result being no discharge of pollutants allowed to enter the storm drain system.

NEW REQUIREMENT: Concrete and other street and road maintenance materials and wastes shall be managed to prevent pollutant discharges

JUSTIFICATION: This requirement provides flexibility in implementation of BMPs with the ultimate result being no discharge of pollutants allowed to enter the storm drain system.

NEW REQUIREMENT: The washout of concrete trucks and chutes shall only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system.

JUSTIFICATION: Regional Board staff have seen inconsistent implementation of this requirement and have revised the language to be clearer while providing flexibility in implementation of BMPs with the ultimate result being no discharge of pollutants allowed to enter the storm drain system.

F. New Development And Significant Redevelopment Program

Water Quality and Storm Water

The water quality impacts of urbanization and urban storm water discharges have been summarized by several recent USEPA reports.[1] Urbanization causes changes in hydrology and increases pollutant loads which adversely impact water quality and impairs the beneficial uses of receiving waters. Increases in population density and imperviousness result in changes to stream hydrology including:

[1] *Storm Water Phase II Report to Congress* (USEPA 1995); Report to Congress on the Phase II Storm Water Regulations (USEPA1999); Coastal Zone Management Measures Guidance (USEPA 1992)

1. increased peak discharges compared to predevelopment levels;
2. increased volume of storm water runoff with each storm compared to pre-development levels;
3. decreased travel time to reach receiving water; increased frequency and severity of floods;
4. reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;
5. increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from chanellization, and
6. decreased infiltration and diminished groundwater recharge.

The Los Angeles County municipal storm water management MS4 program conducts monitoring to:

1. quantify mass emissions for pollutants,
2. identify critical sources for pollutants of concern in storm water;
3. evaluate BMP effectiveness, and
4. evaluate receiving water impacts.

The monitoring indicates that instream concentrations of pathogen indicators (fecal coliform and streptococcus), heavy metals (such as Pb, Cu, Zn,) and pesticides (such as diazinon) exceed state and federal water quality criteria.[1] The mass emissions of pollutants to the ocean are significant from the urban Watershed Management Areas (WMAs) such as the Los Angeles River WMA, Ballona Creek WMA, and Coyote Creek WMA, with the Los Angeles River WMA providing more than seventy percent of the loadings. Critical source data for facilities (such as auto-salvage yards, primary metal facilities, and automotive repair shops) showed that total and dissolved heavy metals (Pb, Cu, Zn, and Cd), and total suspended solids (TSS) exceeded state and federal water quality criteria by as much as one hundred times. The results are consistent with a limited term study conducted by the Regional Board to characterize storm water runoff in the Los Angeles region before the issuance of MS4 permits.[2] Storm water runoff data from predominant land uses showed similar patterns. Light-industrial, commercial and transportation land uses showed the highest range of exceedances. A pesticide (diazinon) showed higher ranges from residential land use. The data for polycyclic aromatic hydrocarbons (PAHs), a known pollutant of concern in urban storm water runoff, is inconclusive but improved analytical methods may yield more definitive results next year. Receiving water impacts studies found that storm water discharges from urban watersheds exhibit toxicity that are attributable to heavy metals. Biosurveys of the sea-bottom showed bioaccumulation of toxicants. Sediment analysis showed higher concentrations of pollutants, such as Pb and PAHs, in urban watersheds rather than rural watersheds (2 to 4 times higher). In addition, toxicity of dry weather flows was
